## Introduction

This document presents the sensitivity analysis performed for informing the number of simulation runs in the analysis of each site, the analysis of each individual site, and the results of re-dating previously shoreline dated sites. All underlying and derived data are available in the online repository for the paper at <https://osf.io/7F9SU>

## Sensitivity analysis

The first figure shows the result of a test run for the site Hovland 5, where the simulations were run 5000 times to identify when the means for the different distance measures converged. This was used to inform the use of 1000 simulation runs for the subsequent analysis of the other sites, as the means appear to have stabilised sufficiently by this point. Hovland 5 was chosen because the site only has a single  $^{14}\text{C}$ -date, giving an uncertain age, and because it is located in an area of the landscape where the landscape results in quite large variability on the distance measures.

### Test-run on Hovland 5 to inform number of simulation runs

## Site analyses

The presentation of simulation results for each individual site also has some additional notes pertaining to edits to the DTM, treatment of  $^{14}\text{C}$ -dates and other relevant information. The sites are presented in alphabetical order.

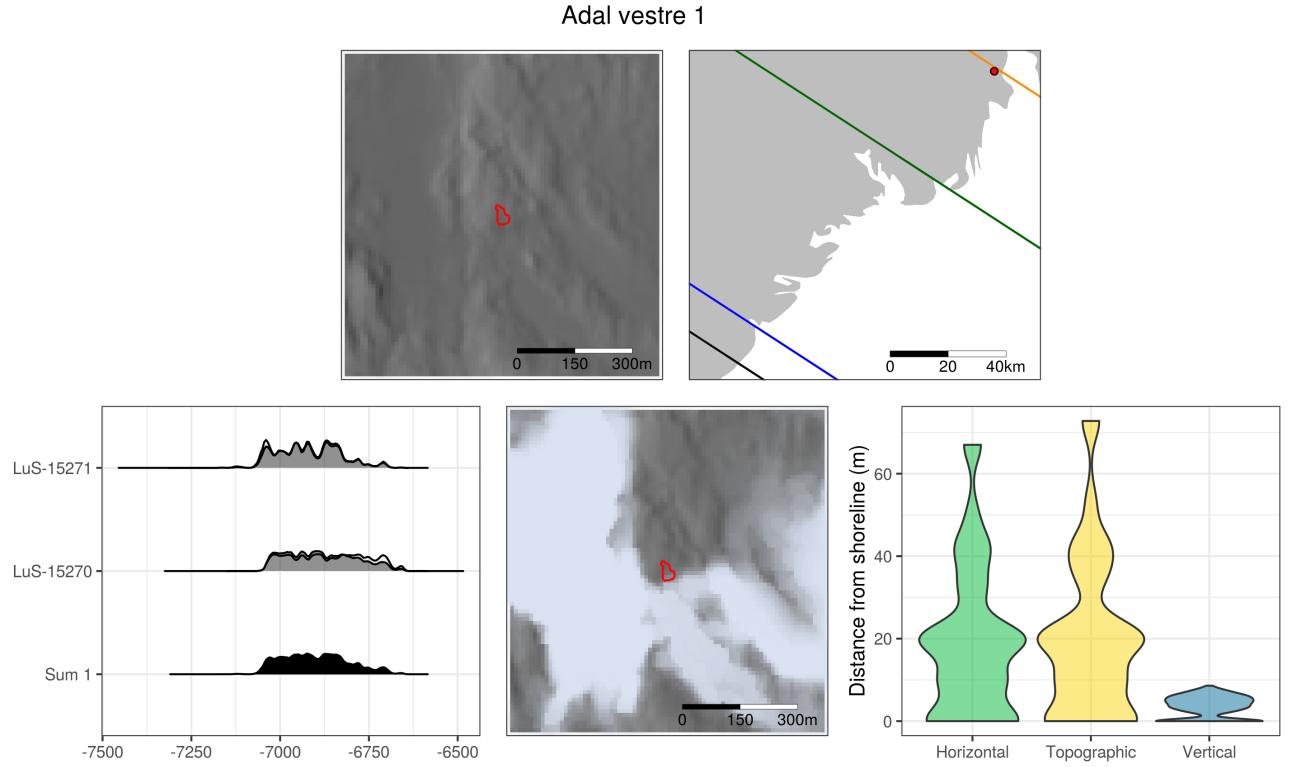

Stone Age sites for which no spatial data was readily available are Frebergsvik A–C (Mikkelsen 1975), Nedre Holtan (Glørstad 1998; Sjursen 1991), Rugtvedt (Odgaard 1994), Tangen (Glørstad 2005), and Torsrød (Østmo 1976). These sites are therefore not included in the analysis. Furthermore, Nielsen (2021) has recently interpreted features from the otherwise younger sites Bratsberg and Larønningen as possibly related to farming activity in the Early Neolithic. However, given the limited number of features, the lack of any artefacts directly related to these, and the therefore somewhat speculative nature of this suggestion, the sites are kept out of the analysis here.

The first plot on the first row for each site shows all calibrated radiocarbon dates from the Stone Age associated with the site (see `analysis/data/raw_data/radiocarbon.csv` for all dates, including those falling outside of the period). The fill colour of the radiocarbon dates indicates whether they are interpreted as belonging to the same phase, and each sum indicates that multiple dates for a phase have been modelled using the Boundary function and then summed using OxCal. Each phase is assumed to be independent of other phases. A red outline indicates that the date(s) were not seen as related to the artefact inventory in the original report. The second plot on the first row displays the site location in the present day landscape on the edited DTM (i.e. highways and railways impacting the adjusted sea-level have been removed, and elevation values are interpolated from the surroundings; see main text and `analysis/script/03dtm_edit.R`). The third plot on the first row shows the site location within the study area relative to the isobases of the shoreline displacement curves in use.

Subsequent rows for each site then show the simulation results. The first plot on these rows shows the probability density function from which site dates were drawn during simulation. The second plot shows the result of the simulation runs, where the intensity of the colour indicates the number of times the sea was simulated to be present at any given location. The third plot displays a violin plot of the measured distances between site and shore-line across all simulation runs.

Table 1: Adal vestre 1

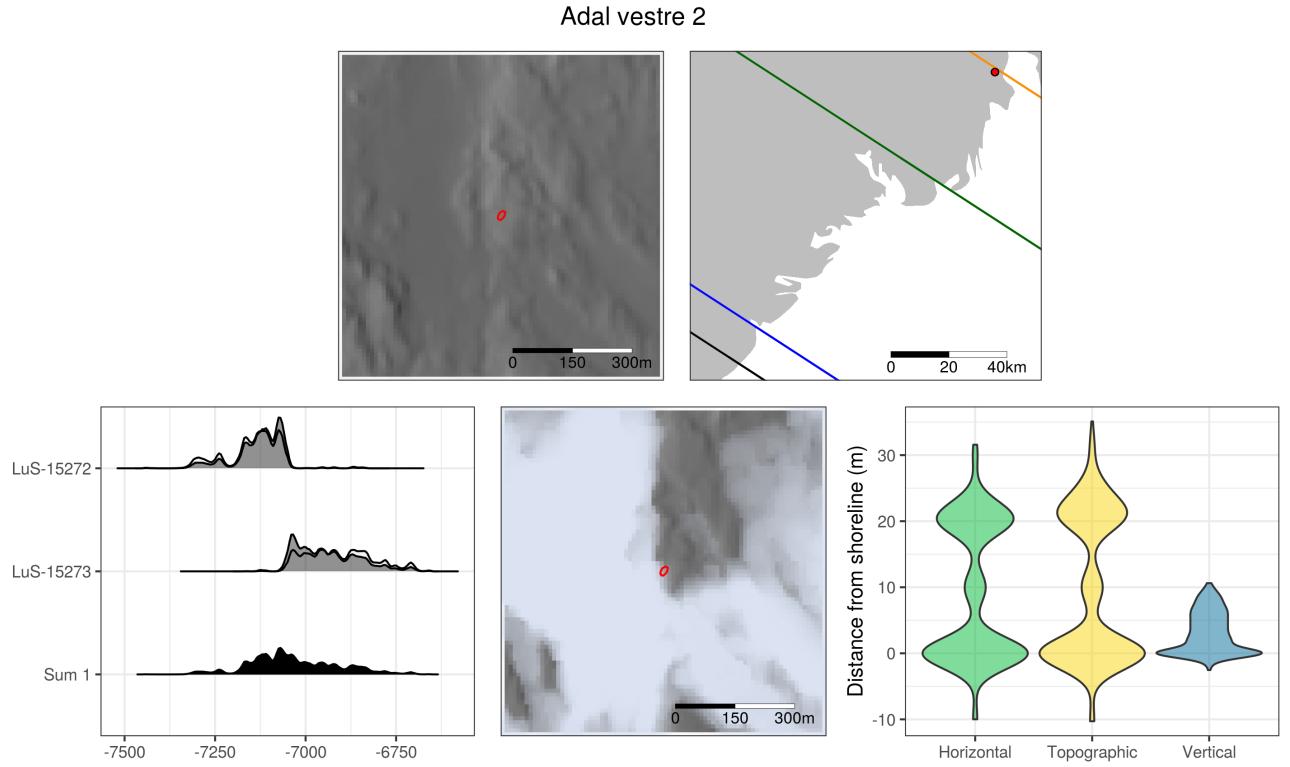

ID	<sup>14</sup> C BP	Error	Material	Context
LuS-15264	665	35	Spruce (Picea)	Possible post hole (ID 4050)
LuS-15265	770	35	Pine (Pinus)	Possible post hole (ID 4050)
LuS-15266	1885	35	Pine (Pinus)	Fireplace (ID 6032)
LuS-16260	3255	35	Conifer (Coniferae indet.)	Cooking pit/fireplace (ID 11485)
LuS-15268	2445	35	Pine (Pinus)	Cooking pit (ID 11508)
LuS-15269	1020	35	Birch (Betula)	Cooking pit (ID 11508)
LuS-15270	7950	45	Hazel (Corylus), nutshell	Cooking pit/fireplace (ID 11521)
LuS-15267	2250	35	Hazel (Corylus), nutshell	Cooking pit/fireplace (ID 11556)
LuS-15271	8020	45	Hazel (Corylus), nutshell	Quadrant (574x401ySW, layer 2/3)

The single-phased lithic inventory matches the radiocarbon dates to the Middle Mesolithic at Adal vestre 1 (Granados 2022). The site is situated close to a field, but this does not appear to have resulted in any relevant changes to the terrain.

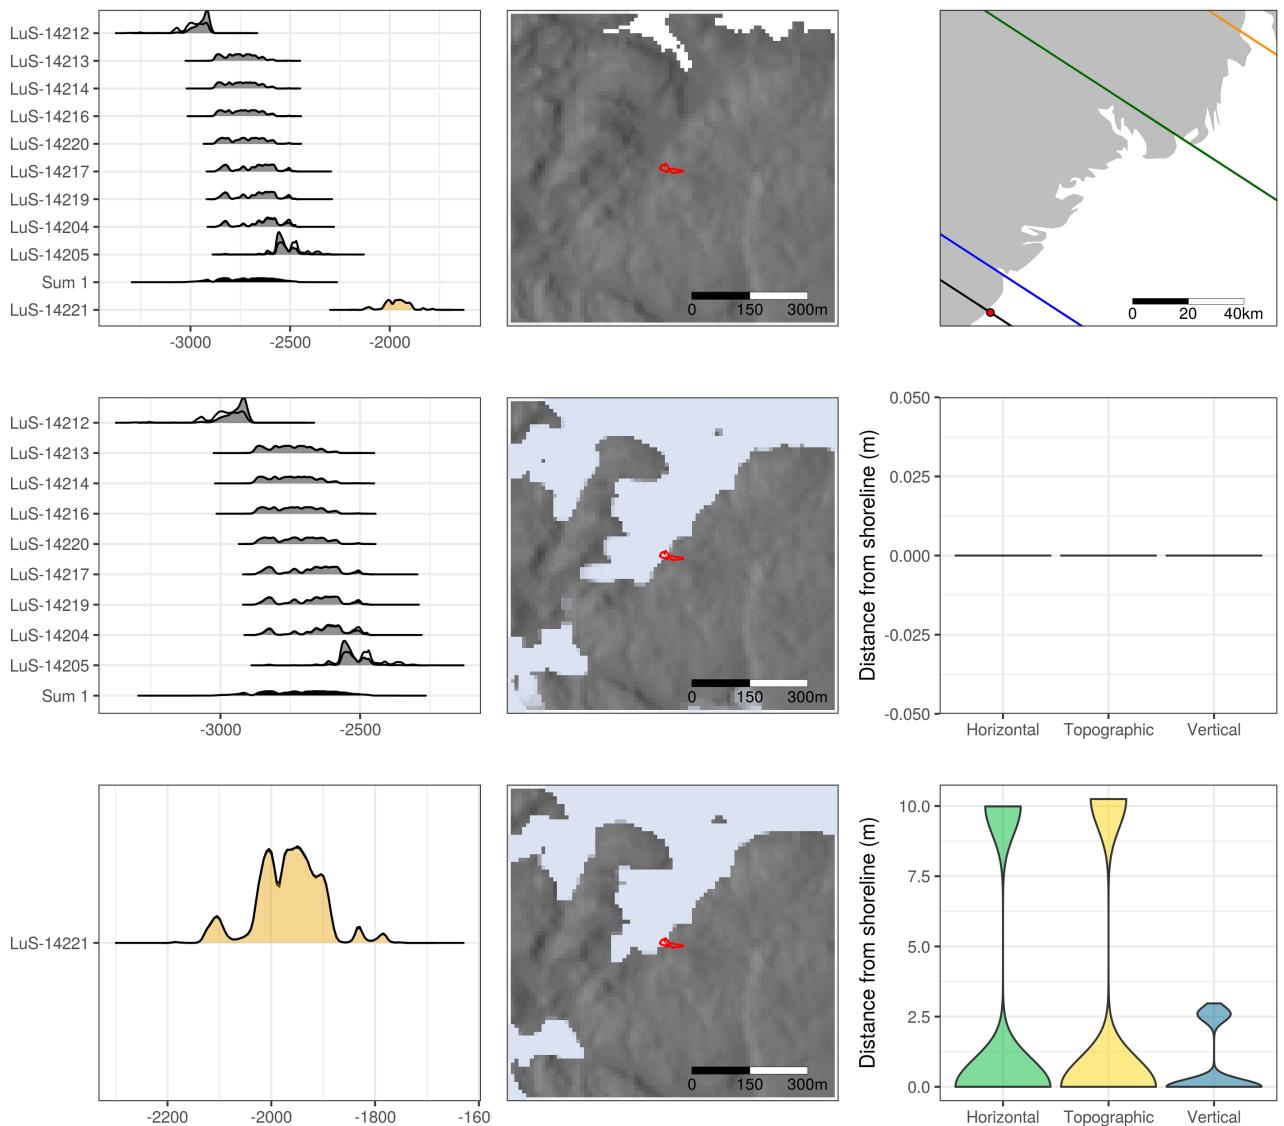

Table 2: Adal vestre 2

ID	$^{14}\text{C}$ BP	Error	Material	Context
LuS-15272	8140	45	Hazel ( <i>Corylus</i> ), nutshell	Cooking pit/fireplace (ID 10036)
LuS-15273	8000	45	Hazel ( <i>Corylus</i> ), nutshell	Cooking pit/fireplace (ID 10051)

The artefact inventory from Adal vestre 2 is single-phased and matches the  $^{14}\text{C}$ -dates (Granados 2022). The site has a similar location in the present day landscape to that of Adal vestre 1 (above) with no apparent indications of relevant impact to the DTM from modern activities.

### Alveberget 8

The artefact inventory at Alveberget 8 matches the radiocarbon dates (Mansrud and Berg-Hansen 2021). The site is located in an undisturbed area of the DTM.

Table 3: Alveberget 8

Ua-46951	7875	52	Willow ( <i>Salix</i> )	Fireplace (ID 10520)
Ua-46952	7744	49	Willow ( <i>Salix</i> )	Fireplace (ID 10520)
Ua-46953	7678	49	Pine ( <i>Pinus</i> )	Fireplace (ID 10520)

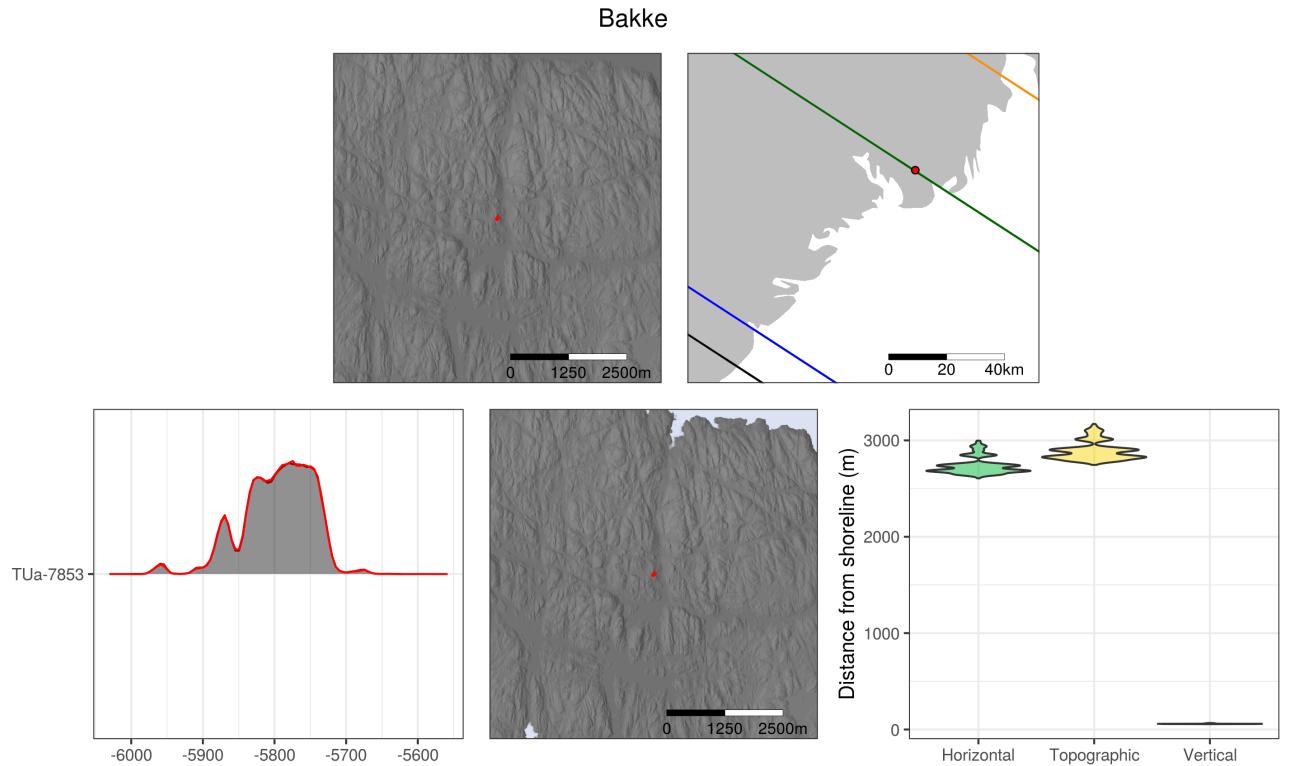

Anvik (Eymundsson 2014a) is situated by the highway and a smaller road. Neither appear to impact the simulation results. The dated fireplace is not seen as related to lithic material, which is believed to hail from the latest part of the Early Mesolithic (c. 8500-8250 BCE).

The site limit for Auve was drawn manually based on the description in the publication of the site and the site geometry available in the database Askeladden. The site is located in and around an intersection of the road, parts of the area has been levelled and farmed, and an area to north-west of the site has reportedly been affected by land-slides (Østmo 2008:16–29), but the extent of this is difficult to ascertain based on maps of the area. As the simulation results appear reasonable (see also map in Østmo 2008:Figure 142), nothing was done to try to correct for these factors.

The radiocarbon date to the Stone Age is not related to the site inventory at Bakke, which is distinctly Early Mesolithic in character (Nyland and Amundsen 2012).

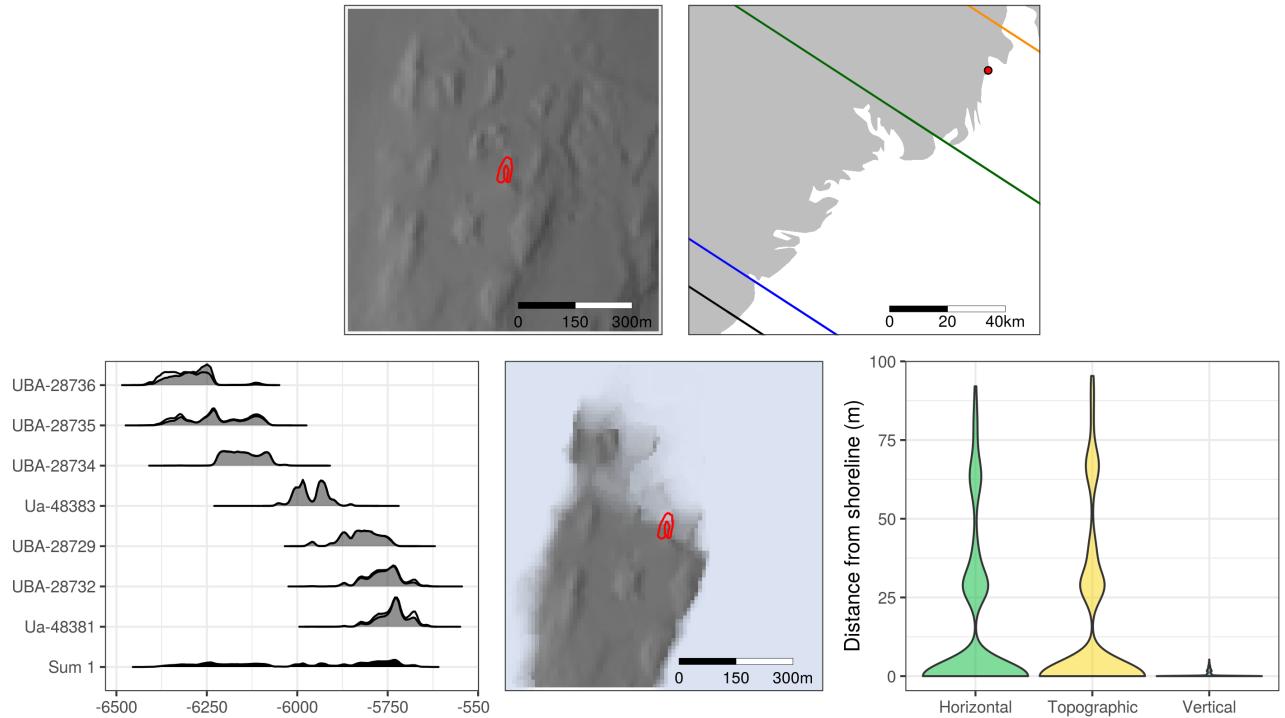

Table 6: Bakke

Brunstad 24

Typological indicators in the lithic inventory from Brunstad 24 matches the  $^{14}\text{C}$ -dates (Danielsen et al.

2018). The footprint of a large building structure covering a large part of the site from the south required editing of the DTM. Apart from that the landscape appears relatively undisturbed. 8 fragments from a pot could potentially correspond with the  $^{14}\text{C}$ -dates to the Late Bronze Age and Early Iron Age, but given their uncertain nature and the limited number of sherds, this was disregarded here.

### Brunstad 25

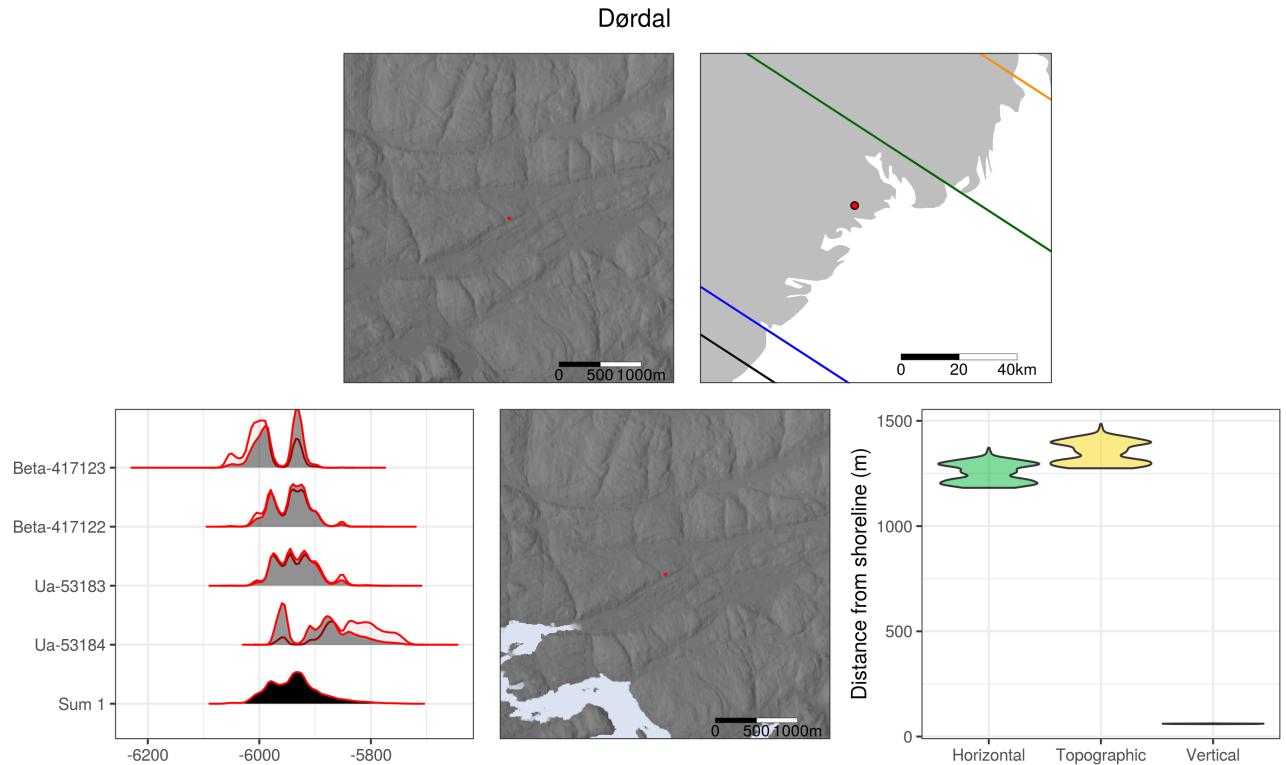

As with Brunstad 24 (above), the artefact inventory from Brunstad 25 matches the radiocarbon dates (Reitan and Solberg 2018a), and the building structure covering the southern part of the site had impacted the DTM

Table 8: Brunstad 25

and had to be removed.

The  $^{14}\text{C}$ -dates from two fireplaces at Dørdal are not related to the lithic inventory, where there are no typological indicators pointing the Late Mesolithic. The report suggest that the results might reflect a contamination through a natural process of some sort (Solheim et al. 2017).

Table 9: Dørdal

Table 11: Dybdalshei 2

ID	$^{14}\text{C}$ BP	Error	Material	Context
Ua-53030	3868	30	Pine (Pinus)	Cooking pit (ID 650)

Dybdalshei 1 was subject to a very limited excavation (Granum and Schülke 2018), and the lack of data might therefore lead one to question whether or not the site actually represent a settlement area. Furthermore, what little lithic material was retrieved is too generic to offer any typological support to the radiocarbon dates of the dated cooking pits. Nonetheless, the site and the  $^{14}\text{C}$ -dates are still treated the same way as the other sites. This is based on the agreement between the  $^{14}\text{C}$ -dates and the spatial relation between the lithic artefacts and the features, which offers some additional support to the notion that the cooking pits represent remnants from visits in the Mesolithic.

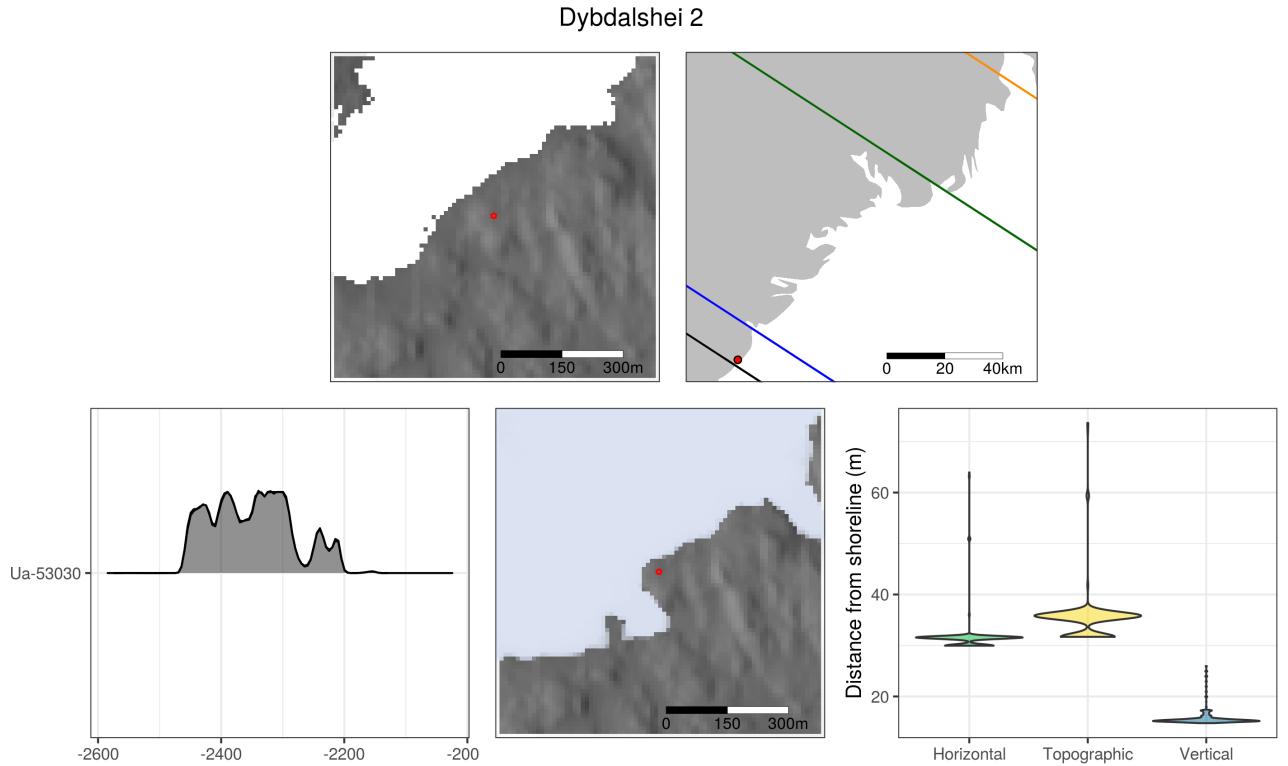

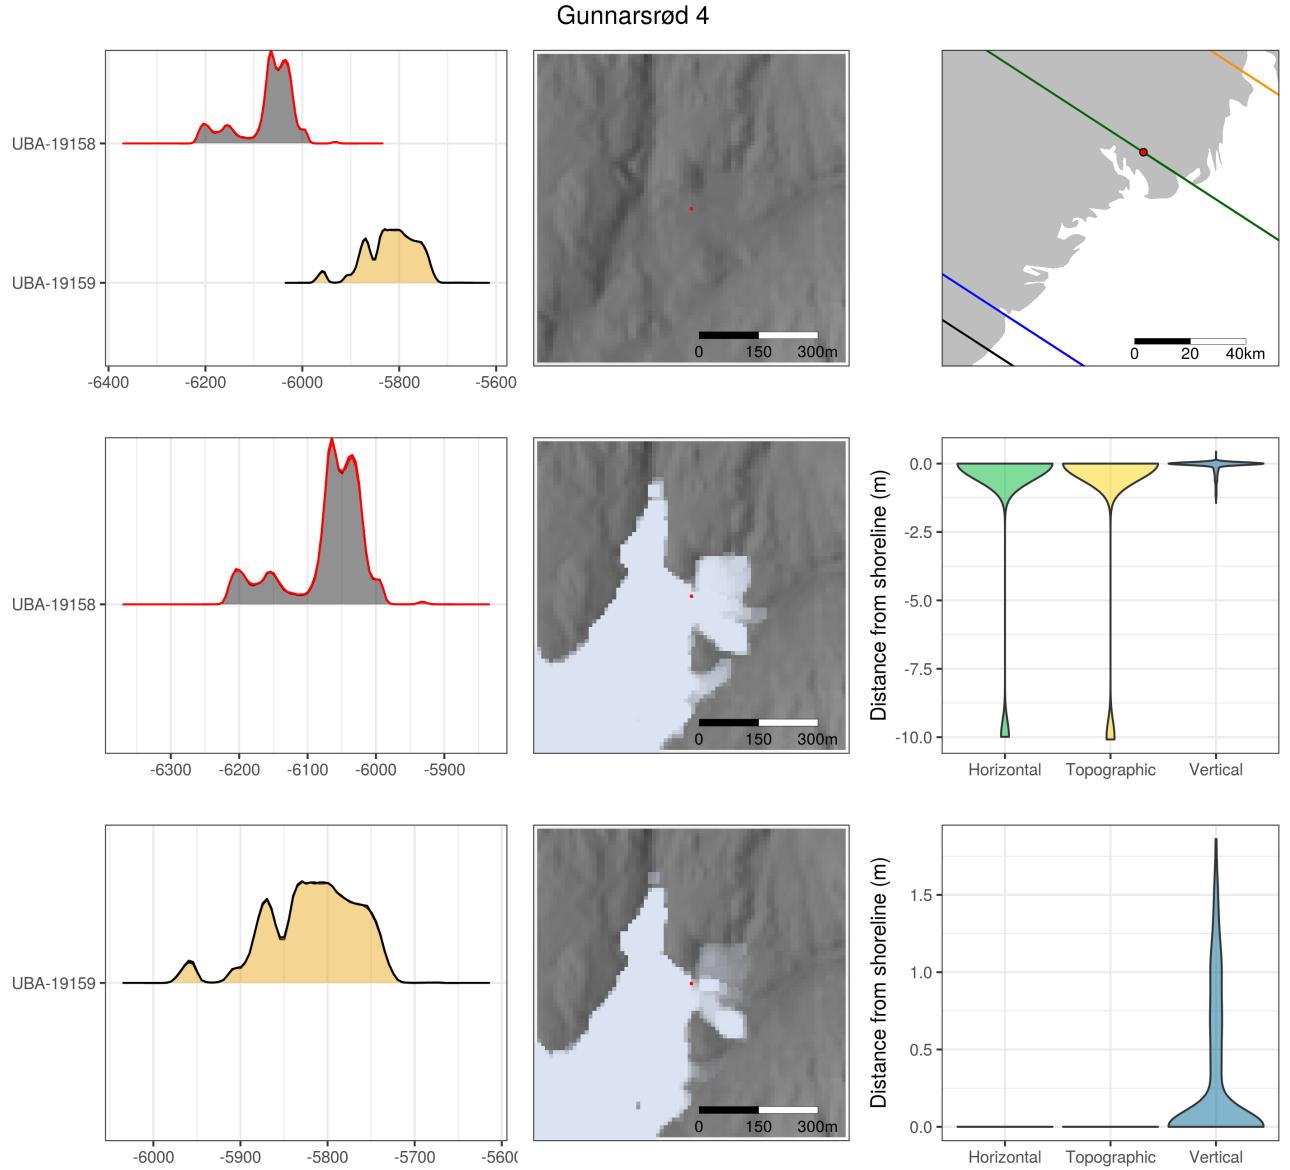

Table 12: Gunnarsrød 4

ID	$^{14}\text{C}$ BP	Error	Material	Context
UBA-19134	2396	24	Hazel ( <i>Corylus</i> )	Fireplace (ID 100000)
UBA-19159	6941	36	Birch ( <i>Betula</i> )	Cultural layer, top (ID 100002)
UBA-19158	7210	38	Pine ( <i>Pinus</i> )	Cultural layer, bottom (ID 100002)

The situation on Dybdalshei 2 is similar to that on Dybdalshei 1 (above, Granum and Schülke 2018), but with only a single date from a single feature and no lithics, the site is not included in subsequent analysis.

The rock-shelter site Gunnarsrød 4 (Reitan 2014a), and Gunnarsrød 5 (below), were situated close to where the railway runs today, and therefore required editing of the DTM. Based on maps from the report, this appears to have given adequate, although not perfect results (Reitan 2014a:Figure 14.7.1). The date from the

bottom of the cultural layer was seen as possibly impacted by old-wood effect, a notion that is in line with the simulation results, as this date would have the site located beneath the sea-level (Reitan 2014a).

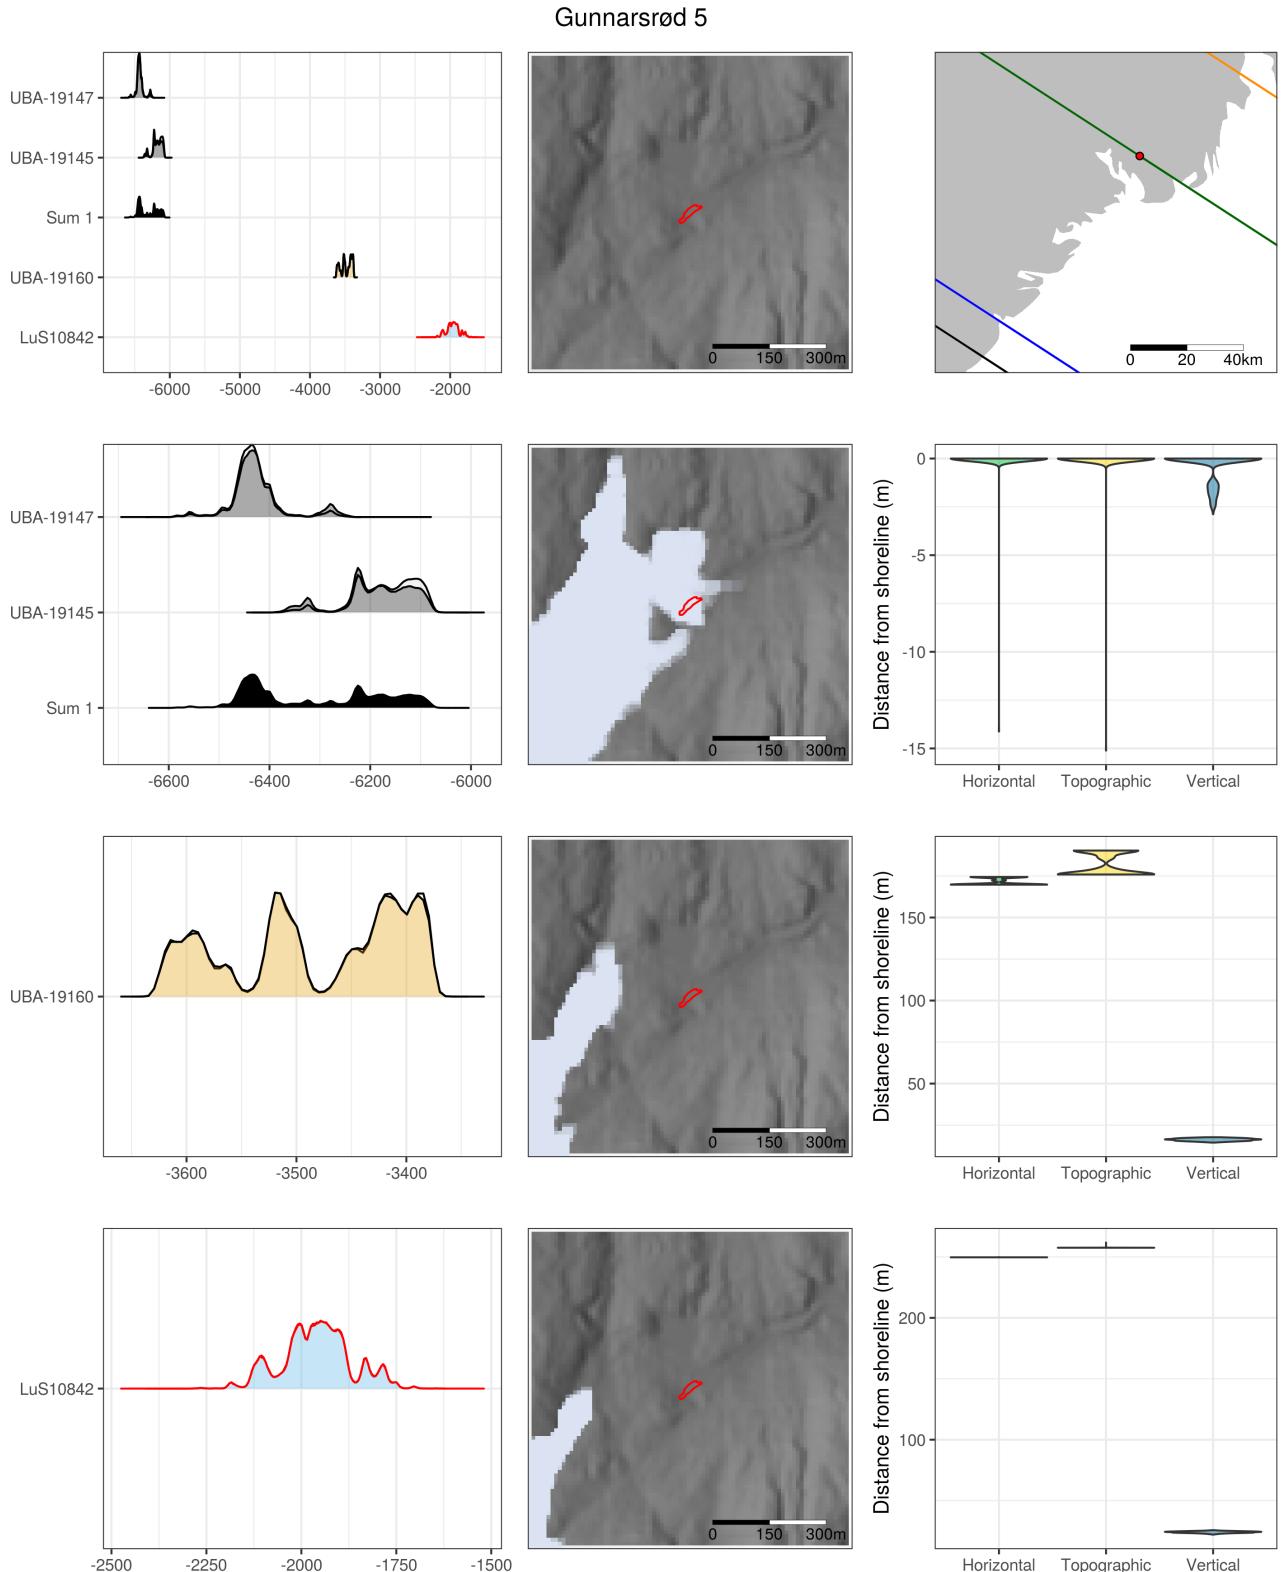

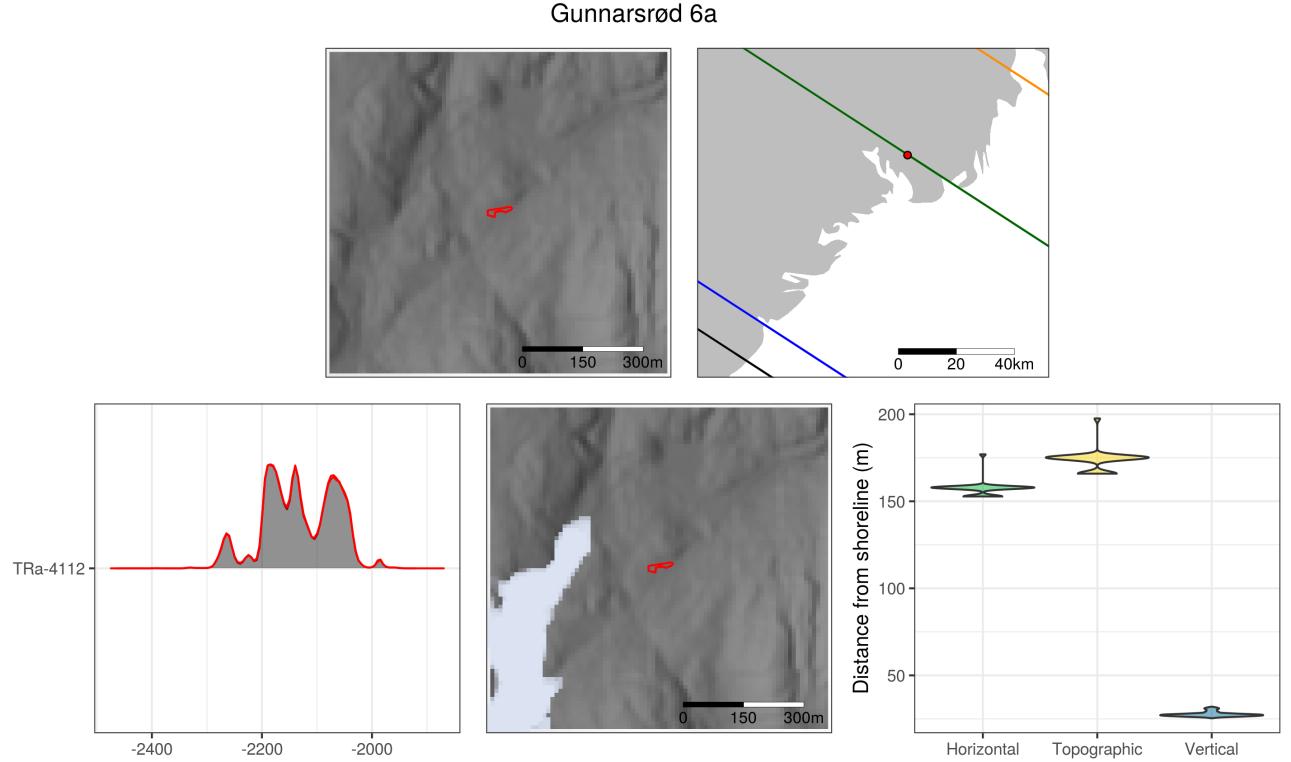

Table 13: Gunnarsrød 5

ID	$^{14}\text{C}$ BP	Error	Material	Context
UBA-19147	7582	47	Hazel ( <i>Corylus</i> ), nutshell	Fireplace (ID 1206)
UBA-19145	7336	38	Birch ( <i>Betula</i> )	Undefined feature (ID 1420)
UBA-19160	4716	31	Hazel (nutshell)/birch ( <i>Corylus/Betula</i> )	Pit with pottery (ID 1519)
LuS-10842	3600	60	Soot extracted from pottery sherd	Pit with pottery (ID 1519)
UBA-19146	168	29	Birch ( <i>Betula</i> )	Disturbance (ID 1085)

The location of Gunnarsrød 5 is today situated at the exit of a railway tunnel. The construction of the tunnel entrance has lead to a removal of parts of what used to be a hill on which the site was situated (Reitan 2014b). While the editing and interpolation of the DTM appears to give reasonable results for the rest of the flatter marsh area where the railway runs today (see also Gunnarsrød 4, above), the site itself would have been situated slightly higher. This has likely led to the negative values on the distance measures. In combination, the simulation results and the site map in the report (Reitan 2014b:Figure 9.1) indicate that the site would not have been situated any significant distance from the shoreline. The negative values have therefore been set to zero for the final aggregative analysis. A note can also be made on the date that is seen as unrelated to the artefact inventory. This is from charcoal from a pit with ceramics which had a far younger date. The date was therefore interpreted as the result of contamination of some kind.

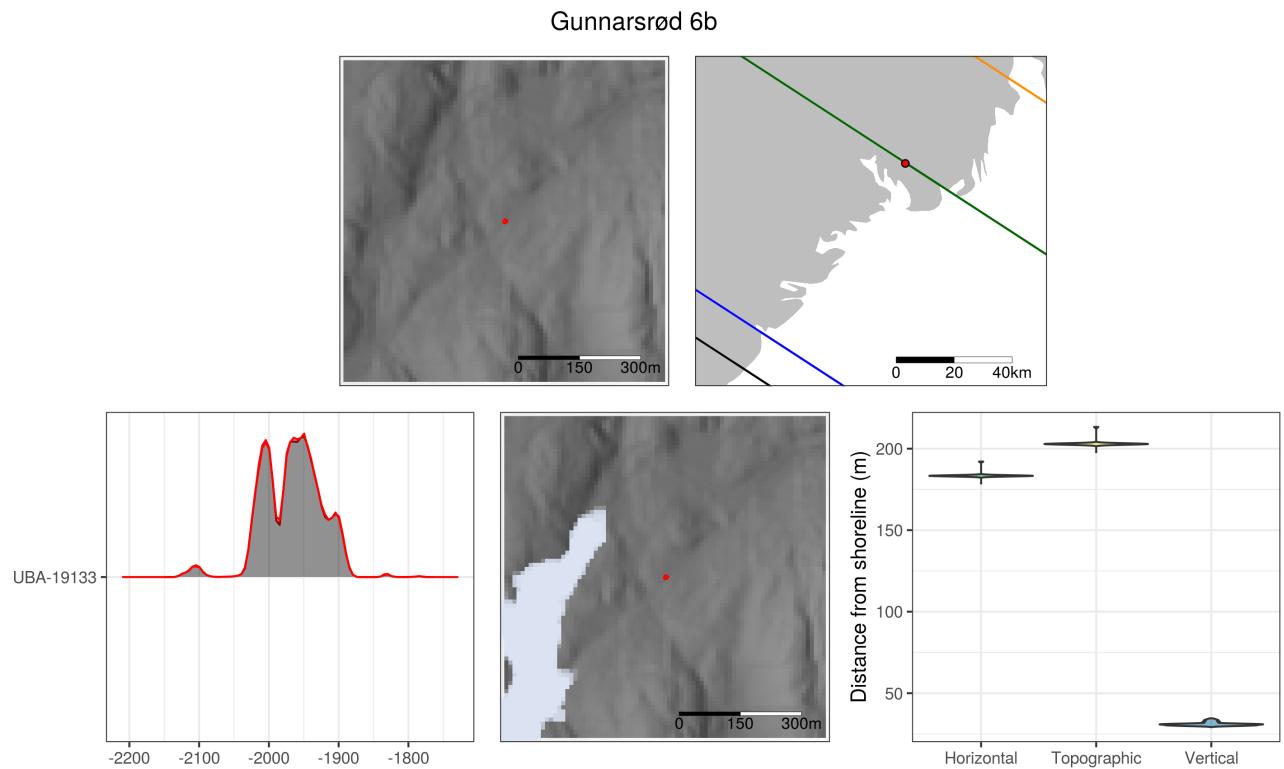

The  $^{14}\text{C}$ -date to the Neolithic from Gunnarsrød 6a is not related to the lithic inventory on the site, which is clearly Mesolithic (Carrasco et al. 2014).

Table 14: Gunnarsrød 6a

ID	$^{14}\text{C}$ BP	Error	Material	Context
TRa-4112	3735	35	Birch/ash (Betula/Fraxinus)	Cooking pit/fireplace (ID 600)
UBA-19130	2369	24	Birch (Betula)	Charcoal layer
UBA-19131	1330	27	Hazel (Corylus), nutshell	Square (965x46y, layer 4)
UBA-19132	883	23	Hazel (Corylus), nutshell	Quadrant (969x49ySE, layer 3)

Table 15: Gunnarsrød 6b

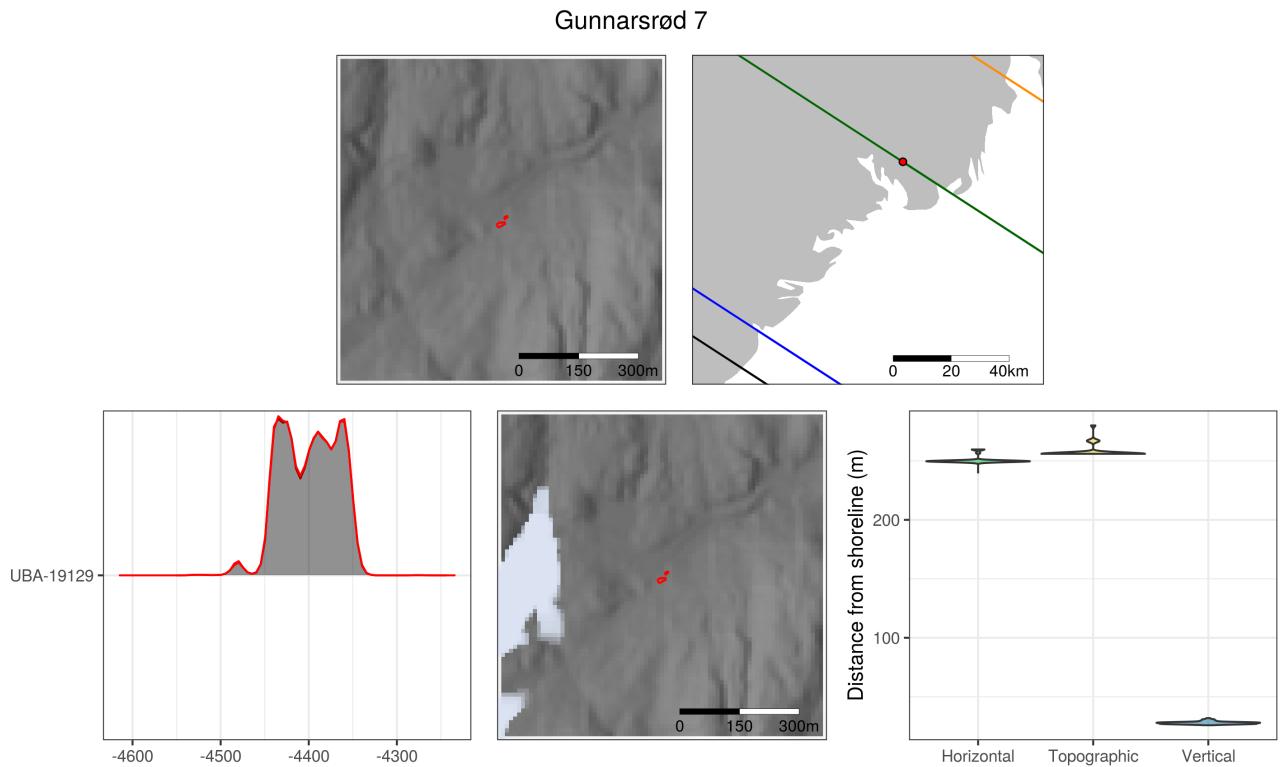

ID	$^{14}\text{C}$ BP	Error	Material	Context
TRa-4113	335	25	Pine (Pinus)	Undefined feature (ID 1313)
UBA-19133	3608	25	Hazel (Corylus), nutshell	Squares (917x626y, 916x626y, layer 5)

As with Gunnarsrød 6a above, the  $^{14}\text{C}$ -date to the Neolithic from Gunnarsrød 6b is not related to the Mesolithic inventory on the site (Carrasco et al. 2014).

Table 16: Gunnarsrød 7

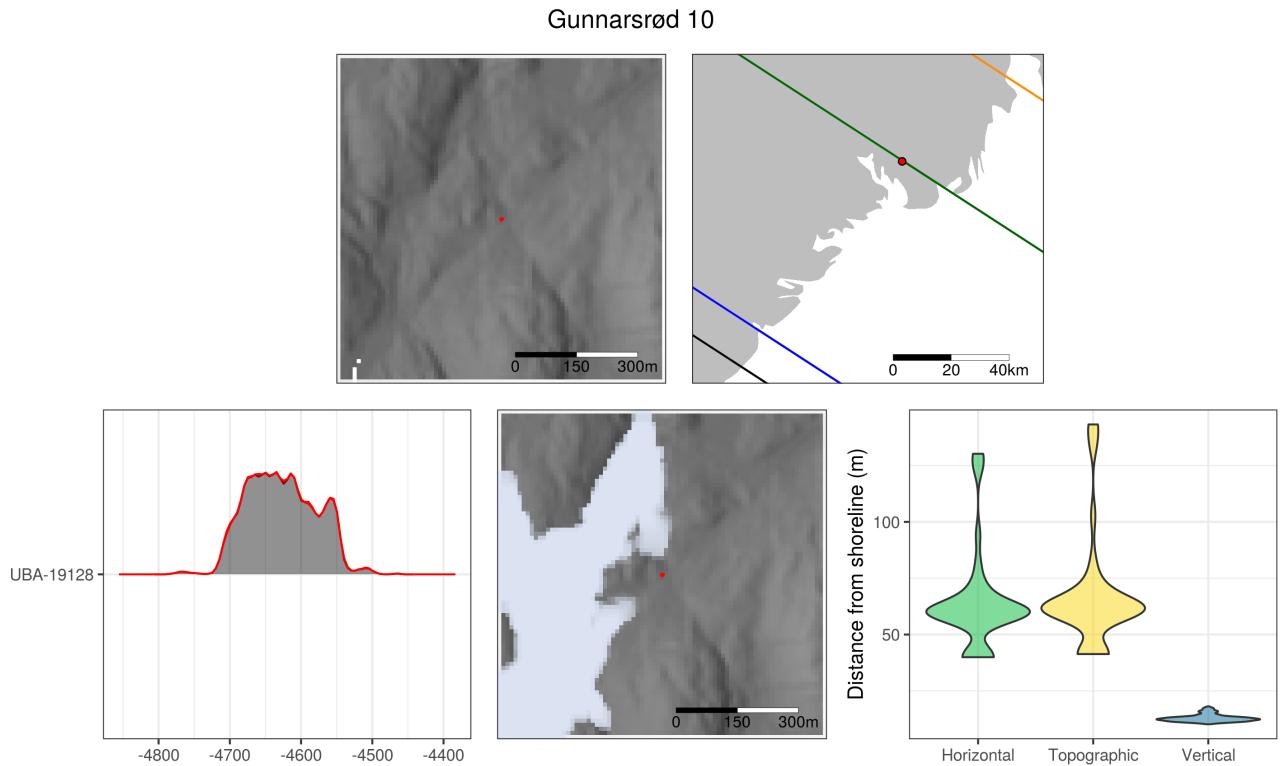

ID	$^{14}\text{C}$ BP	Error	Material	Context
UBA-19129	5563	30	Birch (Betula)	Undefined feature (ID 1000)
UBA-19162	1697	26	Birch/oak (Betula/Quercus)	Undefined feature (ID 1016)

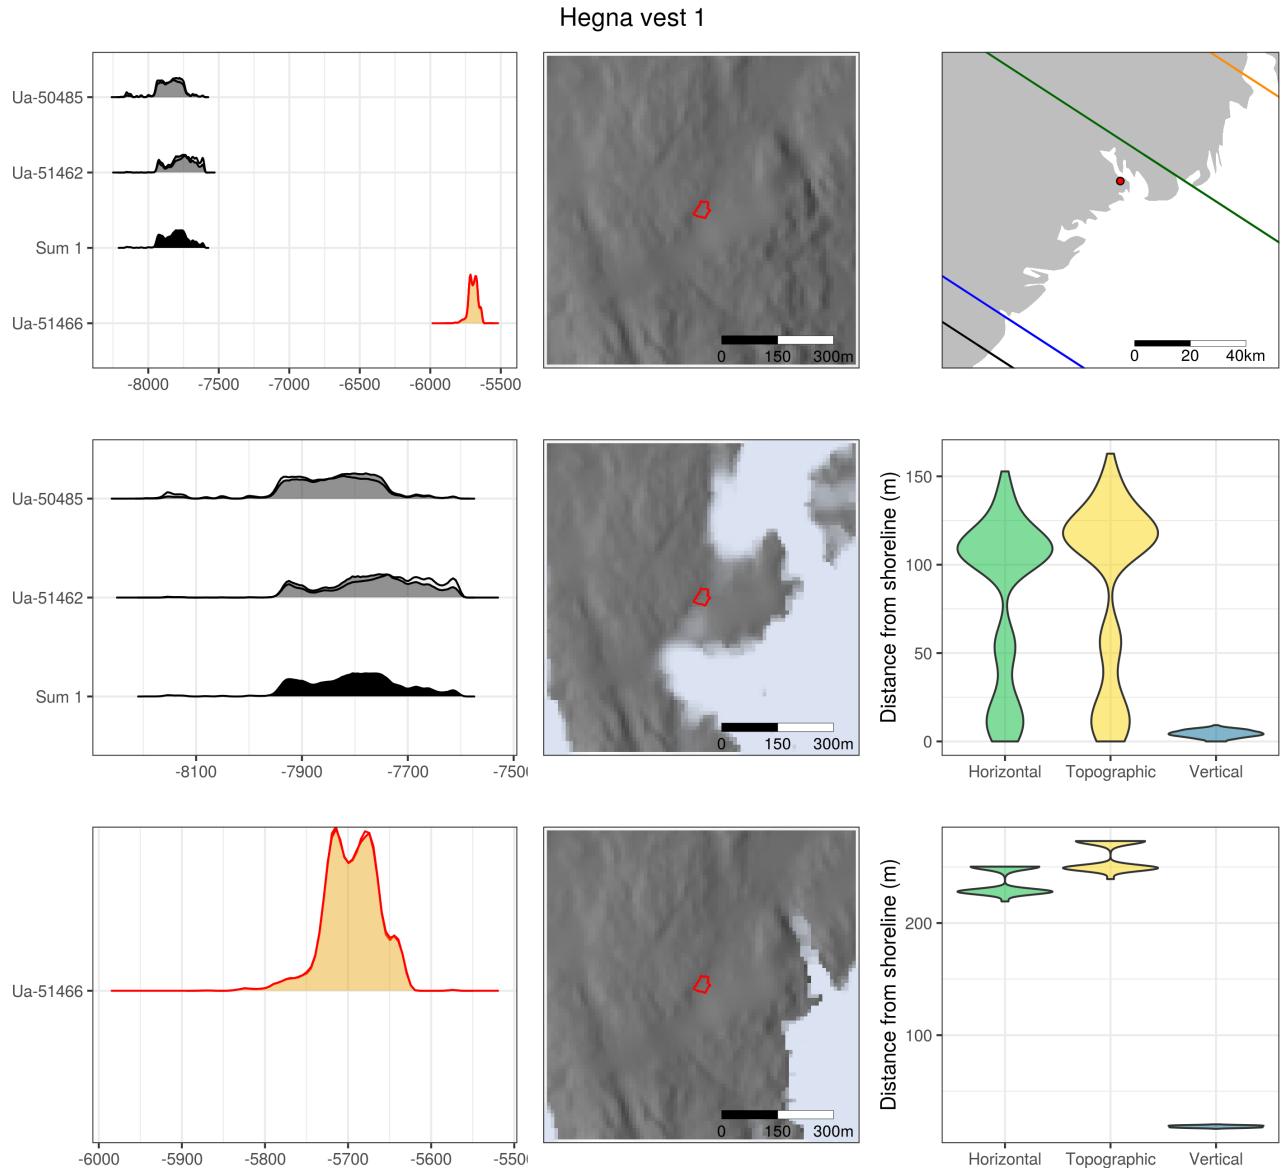

The lithic inventory from Gunnarsrød 7 is of a Middle Mesolithic character and does not match the  $^{14}\text{C}$ -dates (Fossum 2014a).

Table 17: Gunnarsrød 10

ID	$^{14}\text{C}$ BP	Error	Material	Context
UBA-19128	5778	31	Birch (Betula)	Fireplace (ID 100001)

Based on the location of Gunnarsrød 10 on a steep ledge indicating a shore-bound location, and the site inventory, the  $^{14}\text{C}$ -date is not believed to be related to the main occupation of the site (Reitan and Fossum 2014).

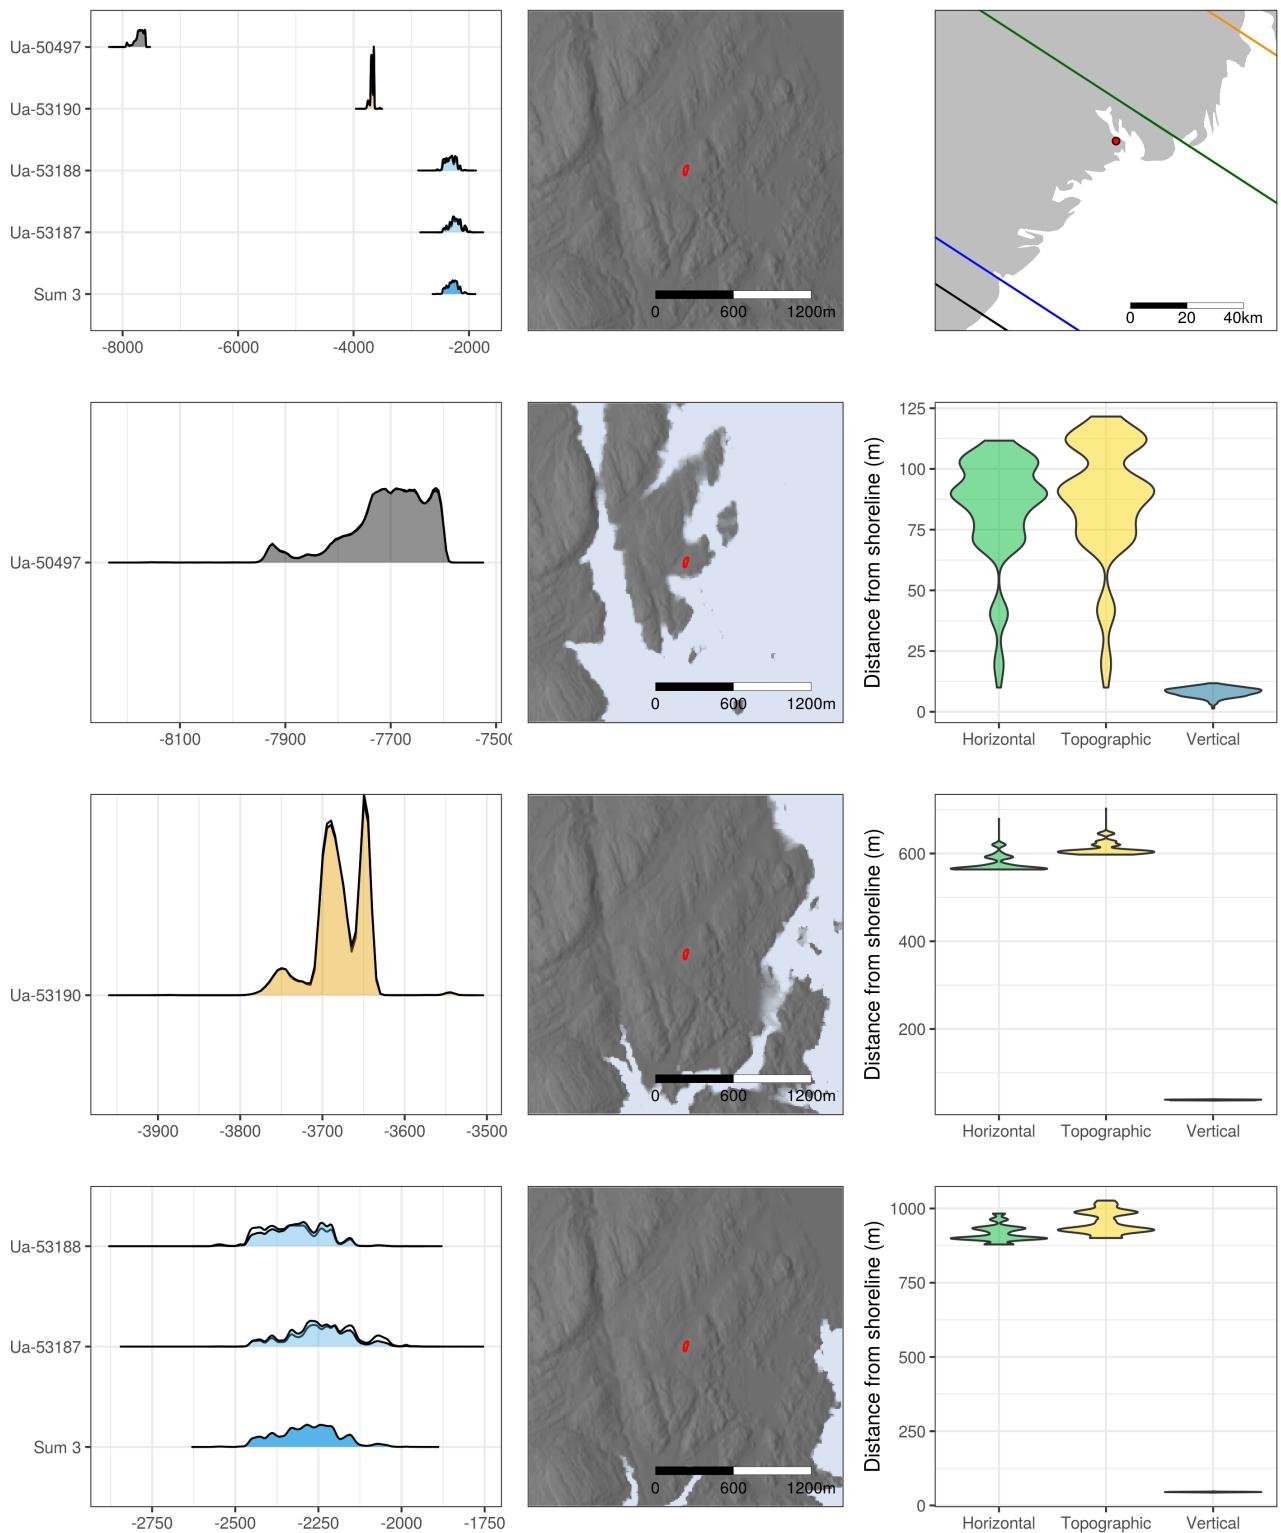

Example site from the main text. Hegna vest 1 has been visited multiple times throughout prehistory. The lithic inventory is distinctly Middle Mesolithic and Neolithic in character, with some finds that might be even younger. This is also reflected in the pottery finds, which are deemed to be from the Bronze Age–Early Iron Age. The  $^{14}\text{C}$ -date to the Late Mesolithic is therefore considered unrelated to the main occupation of the site, as it cannot be related to any elements of the site inventory (Fossum 2017a). The highway runs right by Hegna vest 1 and has been removed. This seems successful in that it doesn't appear to impact the simulated sea-levels.

### Hegna vest 2

As with Hegna vest 1 (above), Hegna vest 2 has been used throughout prehistory. This includes the Middle Mesolithic, the Neolithic, the Bronze Age and the Early Iron Age. The  $^{14}\text{C}$ -dates are believed to be related to

Table 19: Hegna vest 2

ID	<sup>14</sup> C BP	Error	Material	Context

Ua-50489	1781	24	Hazel (Corylus)	Cooking pit (ID 9211)

the site activities (Fossum 2017b). Hegna vest 2 is located where the highway runs today. This was removed, which appears to have been successful in relation to the simulation results.

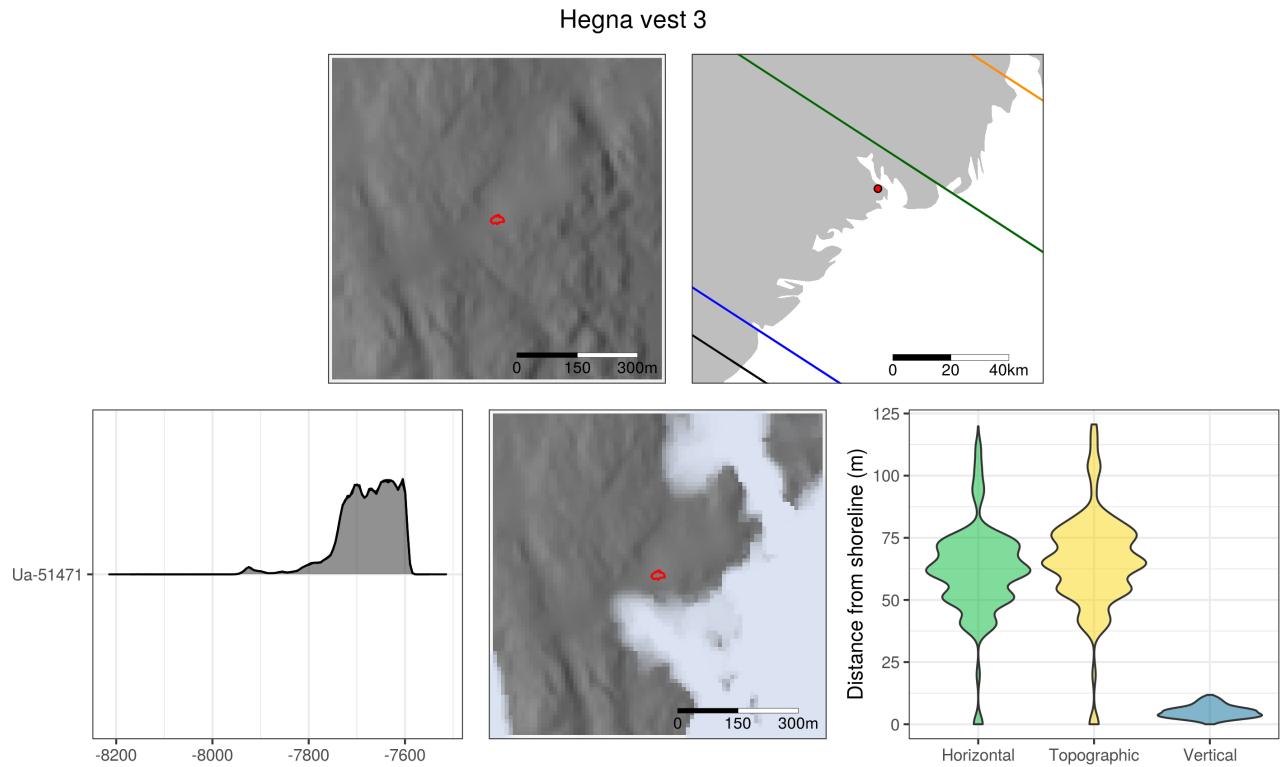

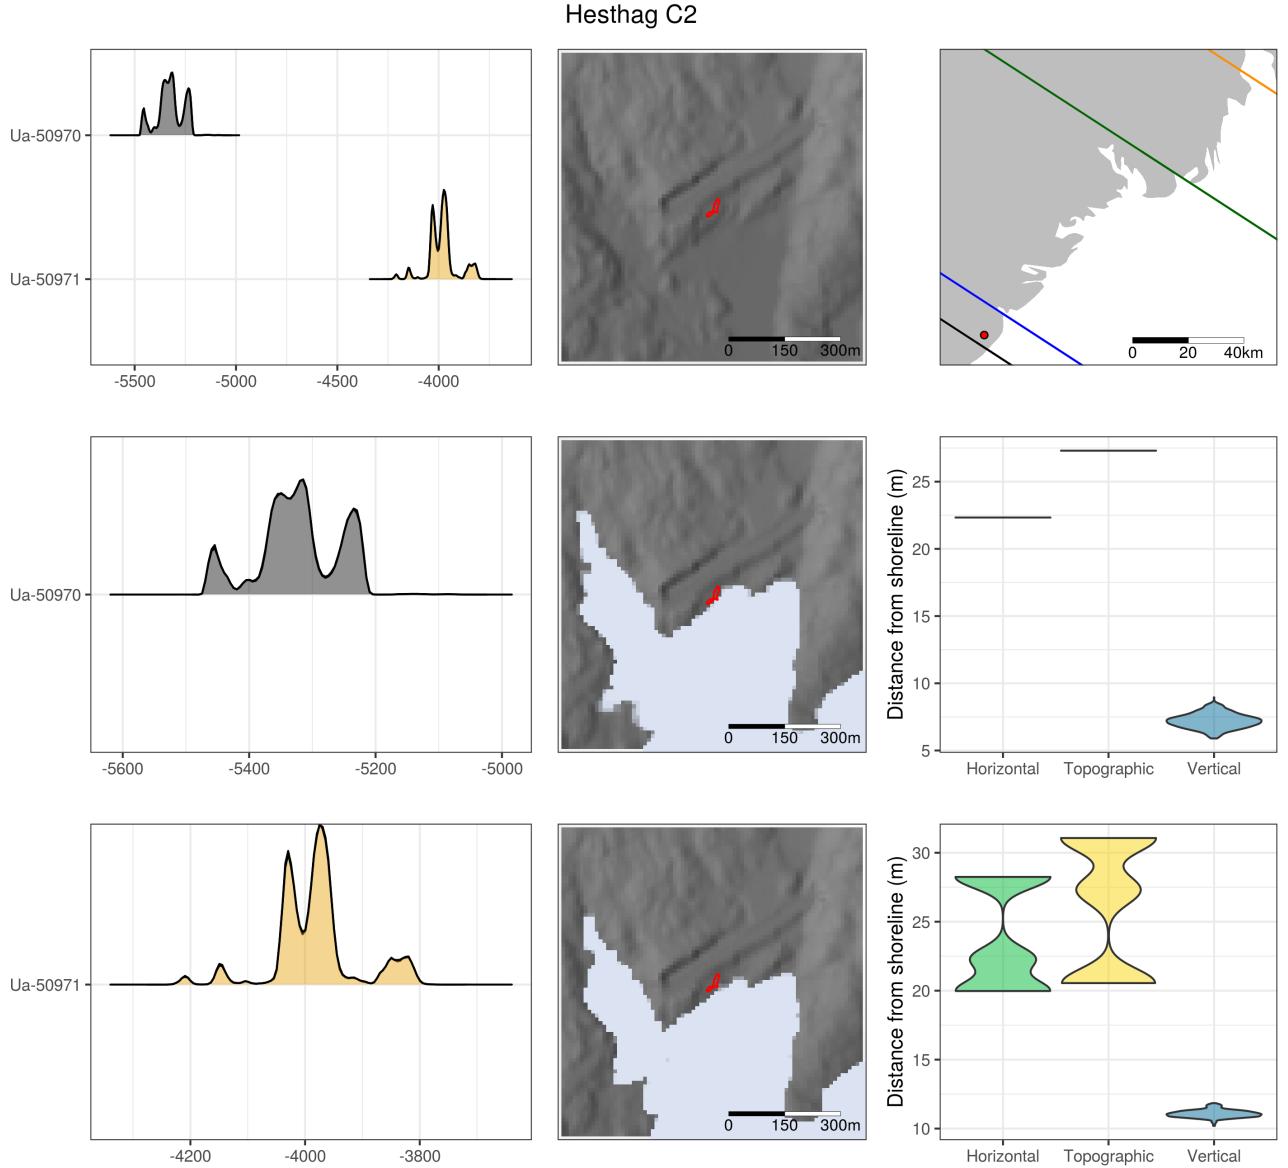

Table 20: Hegna vest 3

ID	$^{14}\text{C}$ BP	Error	Material	Context
Ua-51471	8679	39	Aspen/willow ( <i>Populus/Salix</i> )	Cooking pit (ID 11620)

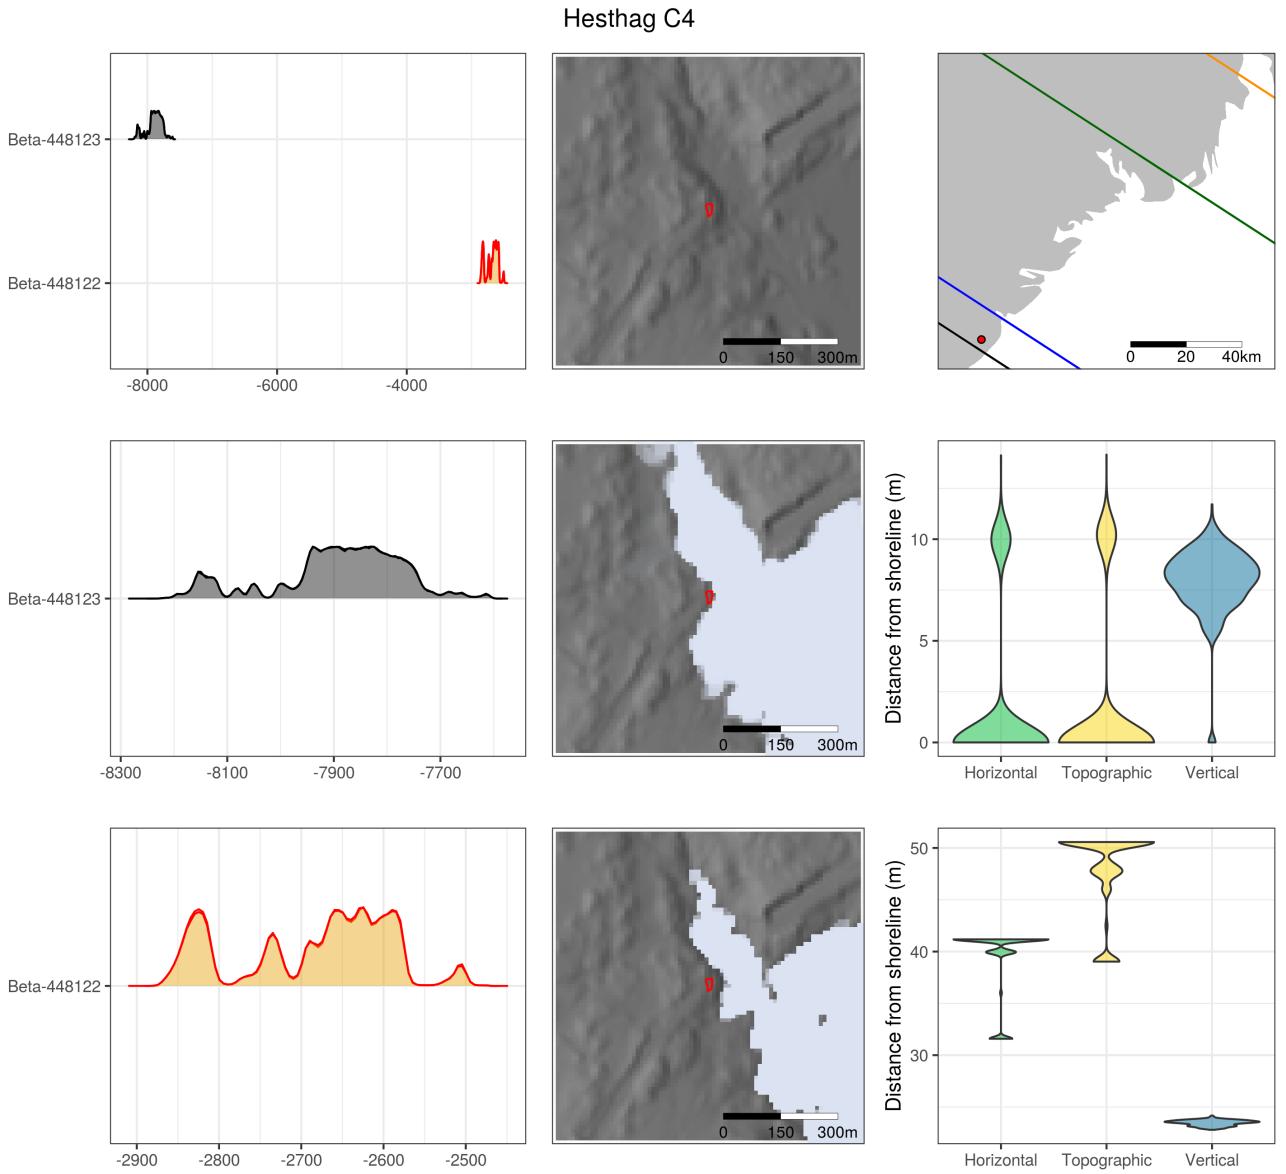

Along with Hegna vest 2 (above), Hegna vest 3 was situated where the highway runs today. The highway has been removed, and it would seem successfully so, as related to the sea-level adjustments. The  $^{14}\text{C}$ -date to the Middle Mesolithic fits well with the lithic inventory (Eigeland and Fossum 2017a).

Hesthag C2 has seen repeated use, as evidenced both by  $^{14}\text{C}$ -dates and the artefact inventory (Viken 2018a). While only a few finds can be typologically dated to the Late Mesolithic, these were deemed substantial enough to trust the two  $^{14}\text{C}$ -dates to the period (Viken 2018a:271). No editing of the DTM was necessary.

Table 21: Hesttag C2

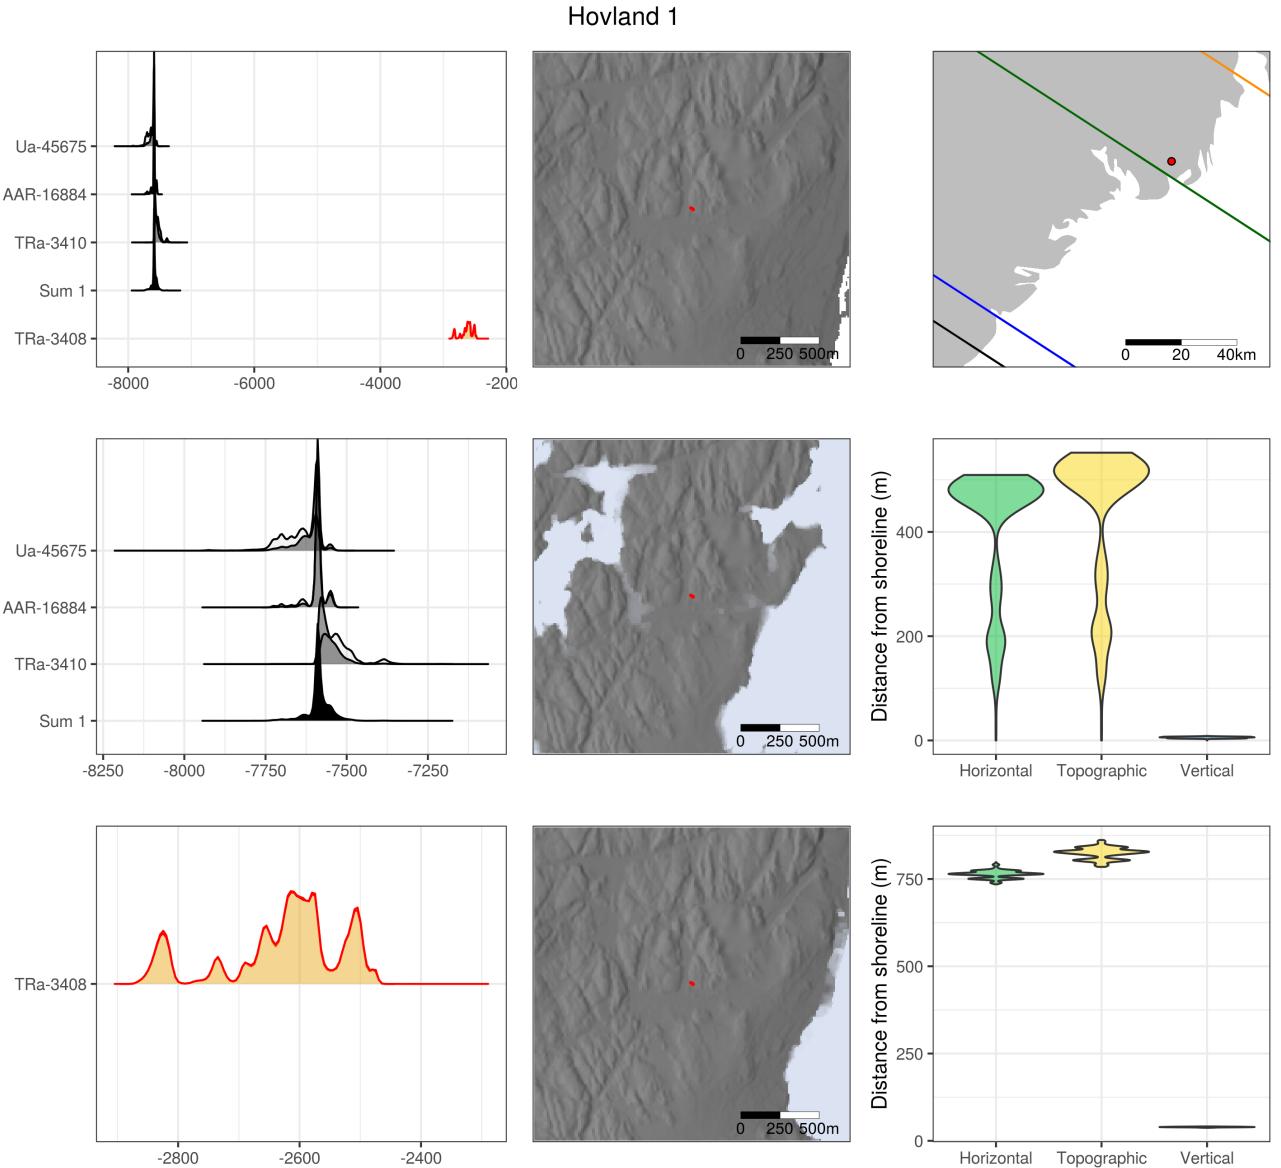

ID	$^{14}\text{C}$ BP	Error	Material	Context
Ua-50970	6351	45	Oak ( <i>Quercus</i> )	Fireplace (ID 2726)
Ua-50971	5172	44	Hazel ( <i>Corylus</i> )	Fireplace (ID 2736)
Ua-50972	2182	30	Birch ( <i>Betula</i> )	Fireplace (ID 4049)
Ua-50984	2143	32	Hazel ( <i>Corylus</i> )	Cooking pit (ID 5366)
Ua-50973	1977	30	Birch ( <i>Betula</i> )	Fireplace (ID 4063)
Ua-50974	1866	31	Birch ( <i>Betula</i> )	Fireplace (ID 4224)

Typology and radiocarbon date match, and there are no modern disturbances in the vicinity of Hesttag C4 (Viken 2018b). The second  $^{14}\text{C}$ -date is a reference date of charcoal from a context believed not to be anthropogenic.

Table 22: Hesttag C4

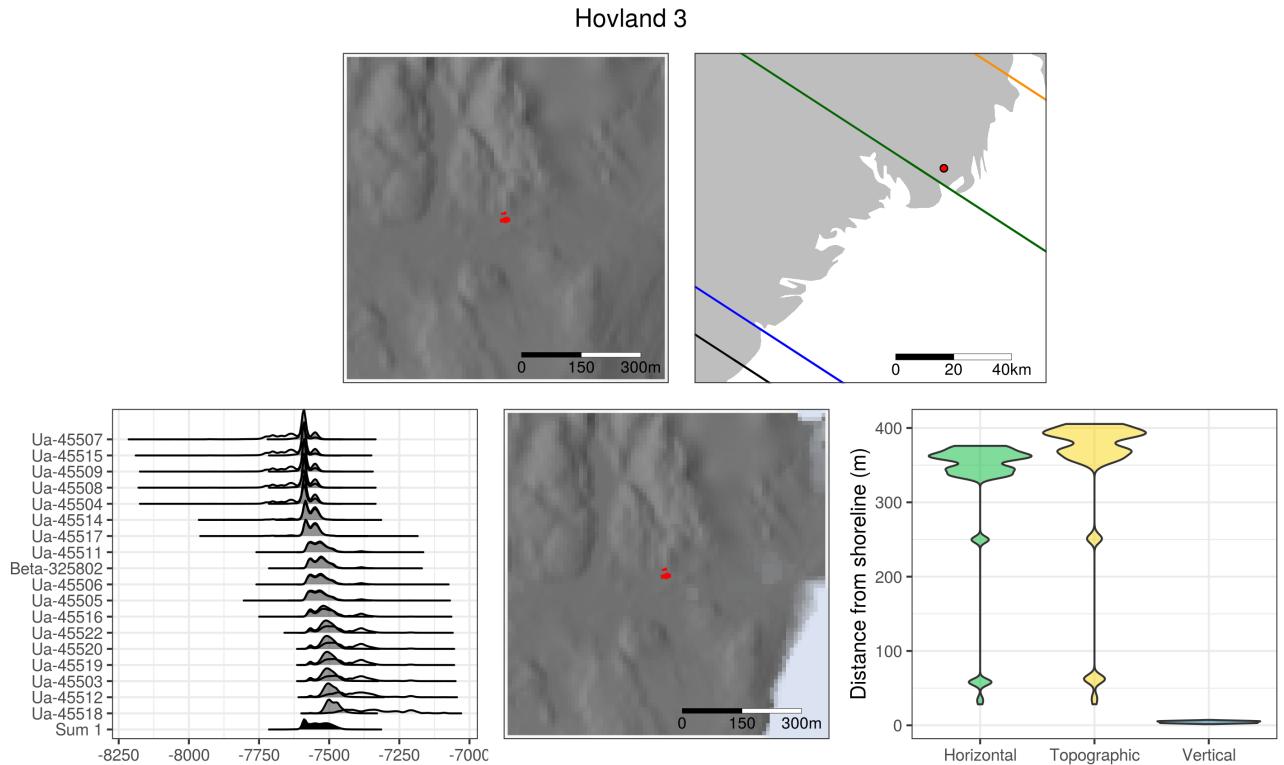

ID	$^{14}\text{C}$ BP	Error	Material	Context
Beta-448123	8800	40	Pine ( <i>Pinus</i> )	Cooking pit (ID 41178)
Beta-448122	4100	30	Birch ( <i>Betula</i> )	Quadrant (993x863yNW)

It was noted in the report that it is uncertain how close to the shoreline Hovland 1 would have been situated, based on the  $^{14}\text{C}$ -dates (Olsen 2013a). The earliest dates match the lithic inventory. The later date is the only indication of activity from the Early Bronze Age/Early Iron Age. The site is not located far from the highway, which was also edited for the analysis of Hovland 1 and 4, as well as Torstvet (see below). It could be noted that all of the Hovland sites and Torstvet (sites from the E18 Brunlanes project) are located at a relatively short vertical distance from the sea, but the terrain makes this result in quite high horizontal and topographic distances.

Table 23: Hovland 1

ID	<sup>14</sup> C BP	Error	Material	Context
TRA-3410	8465	55	Hazel ( <i>Corylus</i> )	Cooking pit (ID 4)
Ua-45675	8623	50	Aspen/willow ( <i>Populus/Salix</i> )	Cooking pit (ID 4)

Ua-45498	1751	31	Hazel (Corylus), nutshell	Quadrant (101x59yNE, layer 2)

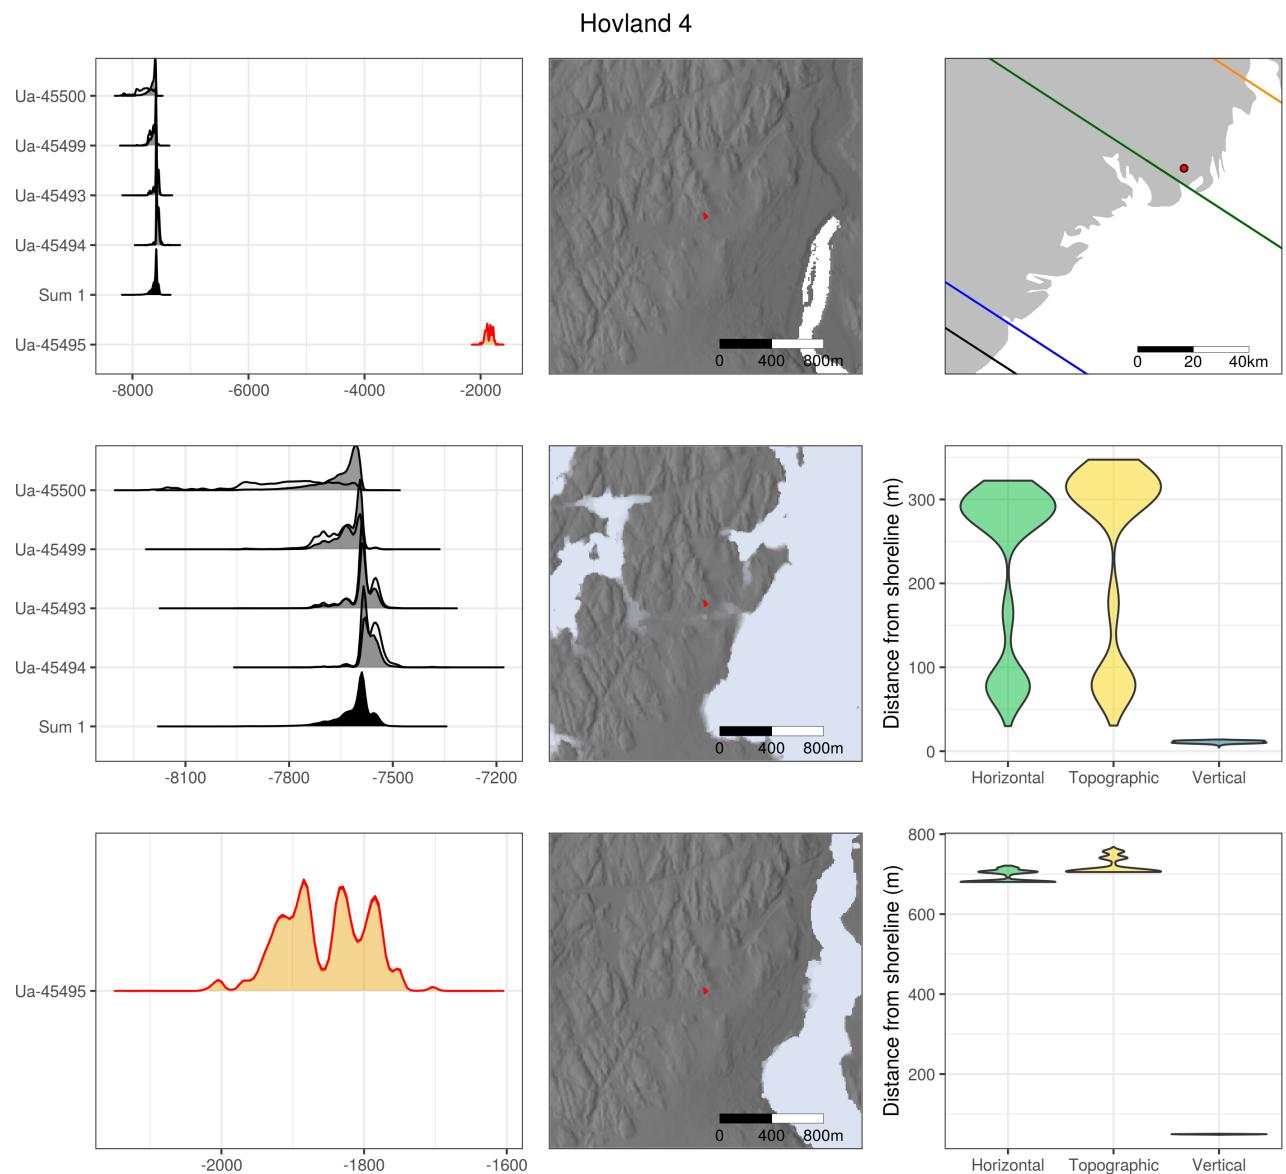

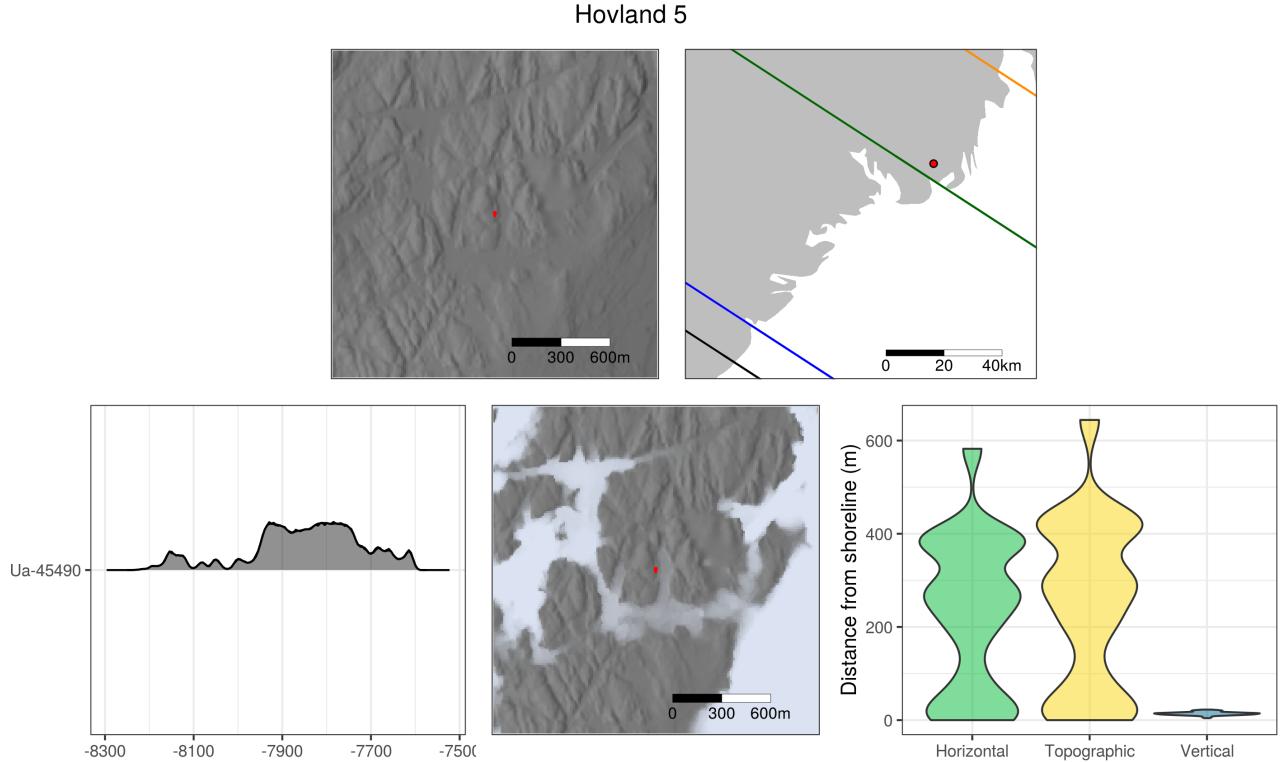

Table 26: Hovland 5

ID	$^{14}\text{C}$ BP	Error	Material	Context
Ua-45490	8775	52	Hazel ( <i>Corylus</i> ), nutshell	Quadrant (66x104ySE, layer 2)
Ua-45491	2674	34	Hazel ( <i>Corylus</i> ), nutshell	Quadrant (67x104ySE, layer 1)

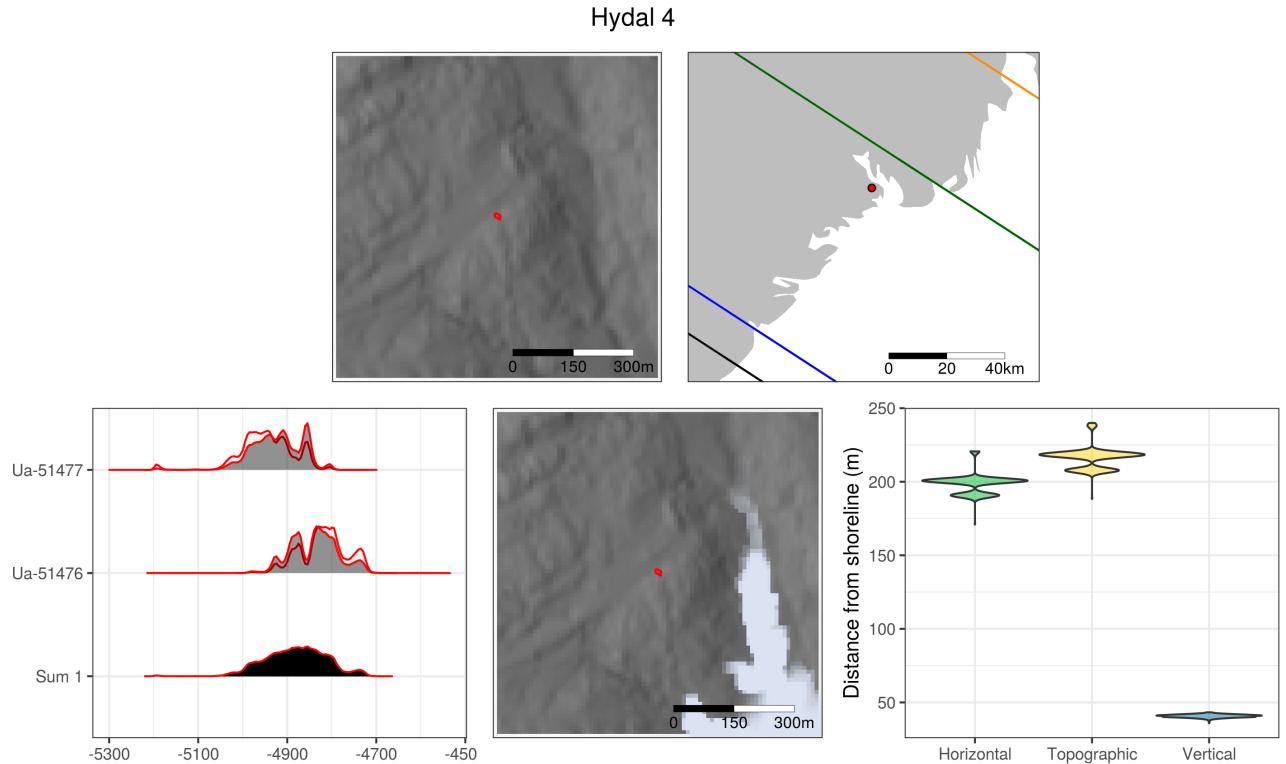

Hovland 4 is well-dated both typologically and with  $^{14}\text{C}$ -dates to the Mesolithic (Mansrud 2013a). It has a similar location to that of Hovland 3 (above), and editing of the highway seems to have been successful.

Hovland 5 is situated more withdrawn from the highway than the other Hovland sites (above), and the DTM did therefore not require any editing. The site only has a single  $^{14}\text{C}$ -date to the Stone Age, but this does match the typological indicators of the assemblage (Mansrud and Koxvold 2013).

Table 27: Hydal 4

ID	$^{14}\text{C}$ BP	Error	Material	Context
Ua-51475	2064	33	Willow (Salix)	Grave, urn (ID 5442)
Ua-51476	5944	35	Oak (Quercus)	Fireplace (ID 5459)
Ua-51477	6049	36	Hazel (Corylus), nutshell	Square (107x604y, layer 2)
Ua-51478	2361	29	Burnt bone, human	Grave, urn (ID 5442)

The lithic inventory from Hydal 4 is distinctly Middle Mesolithic in character, and therefore does not match the  $^{14}\text{C}$ -dates to the Late Mesolithic (Koxvold 2017a). The simulation of the sea-level does not appear impacted by any modern disturbances.

### Krøgenes D1

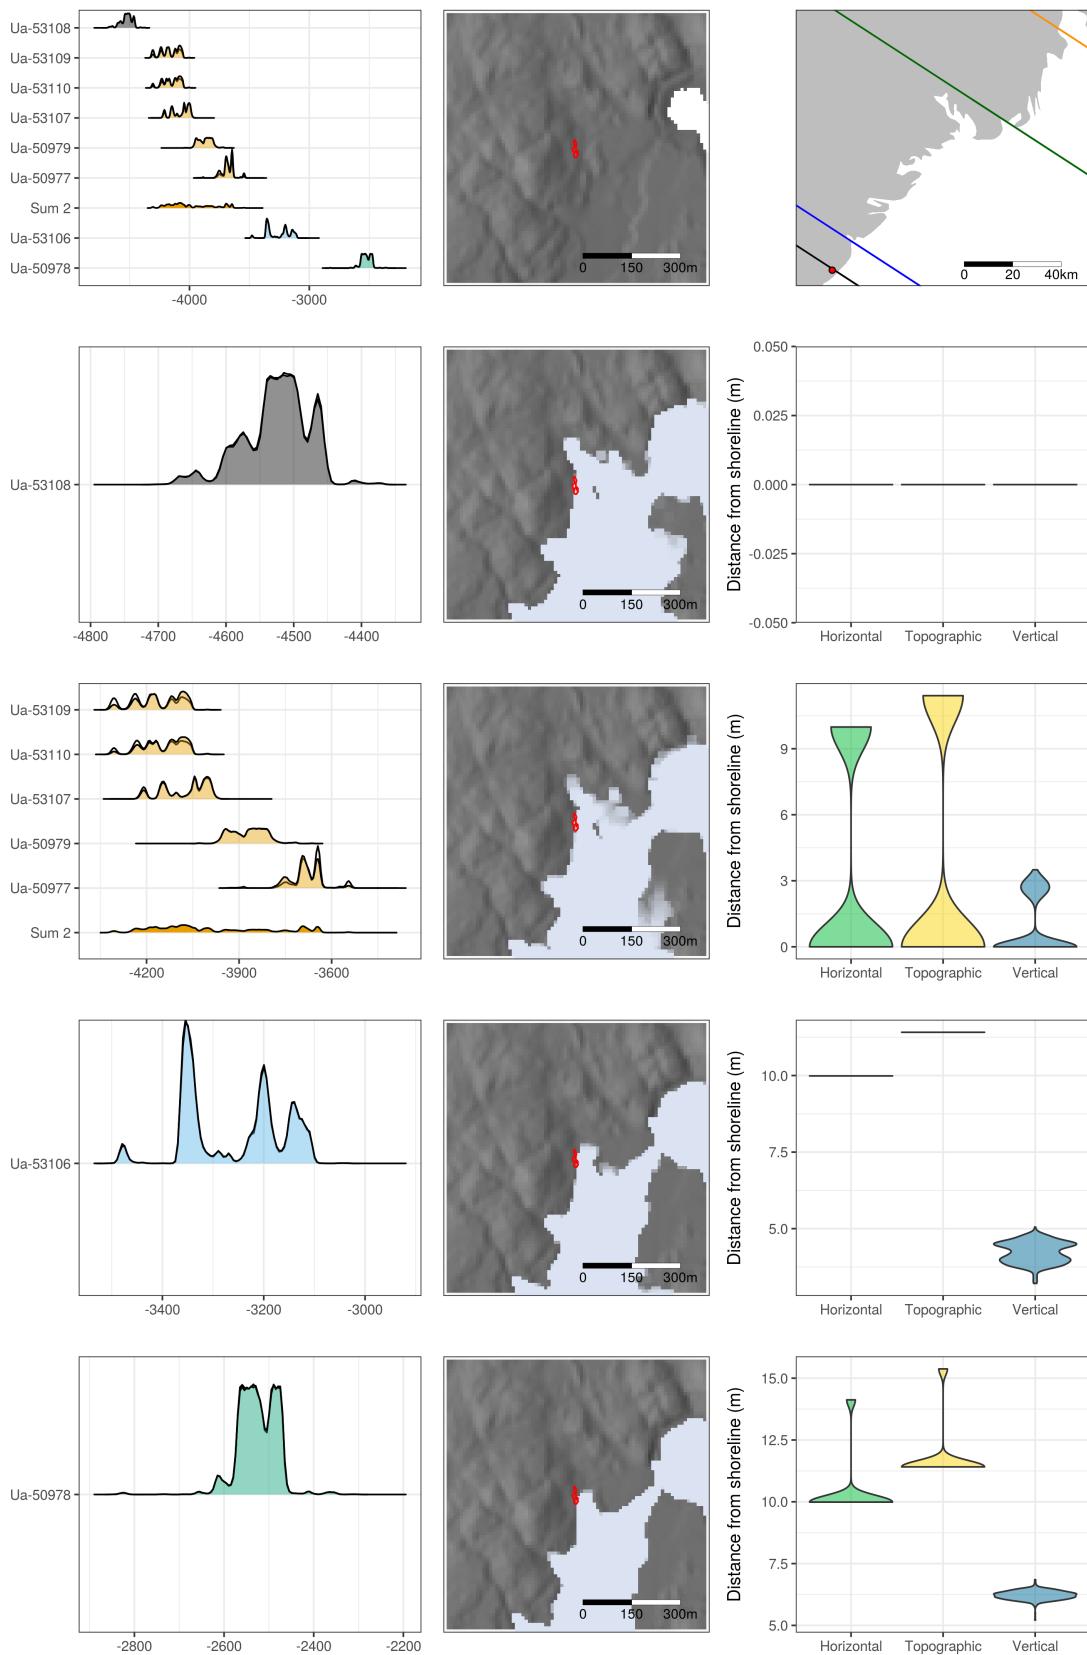

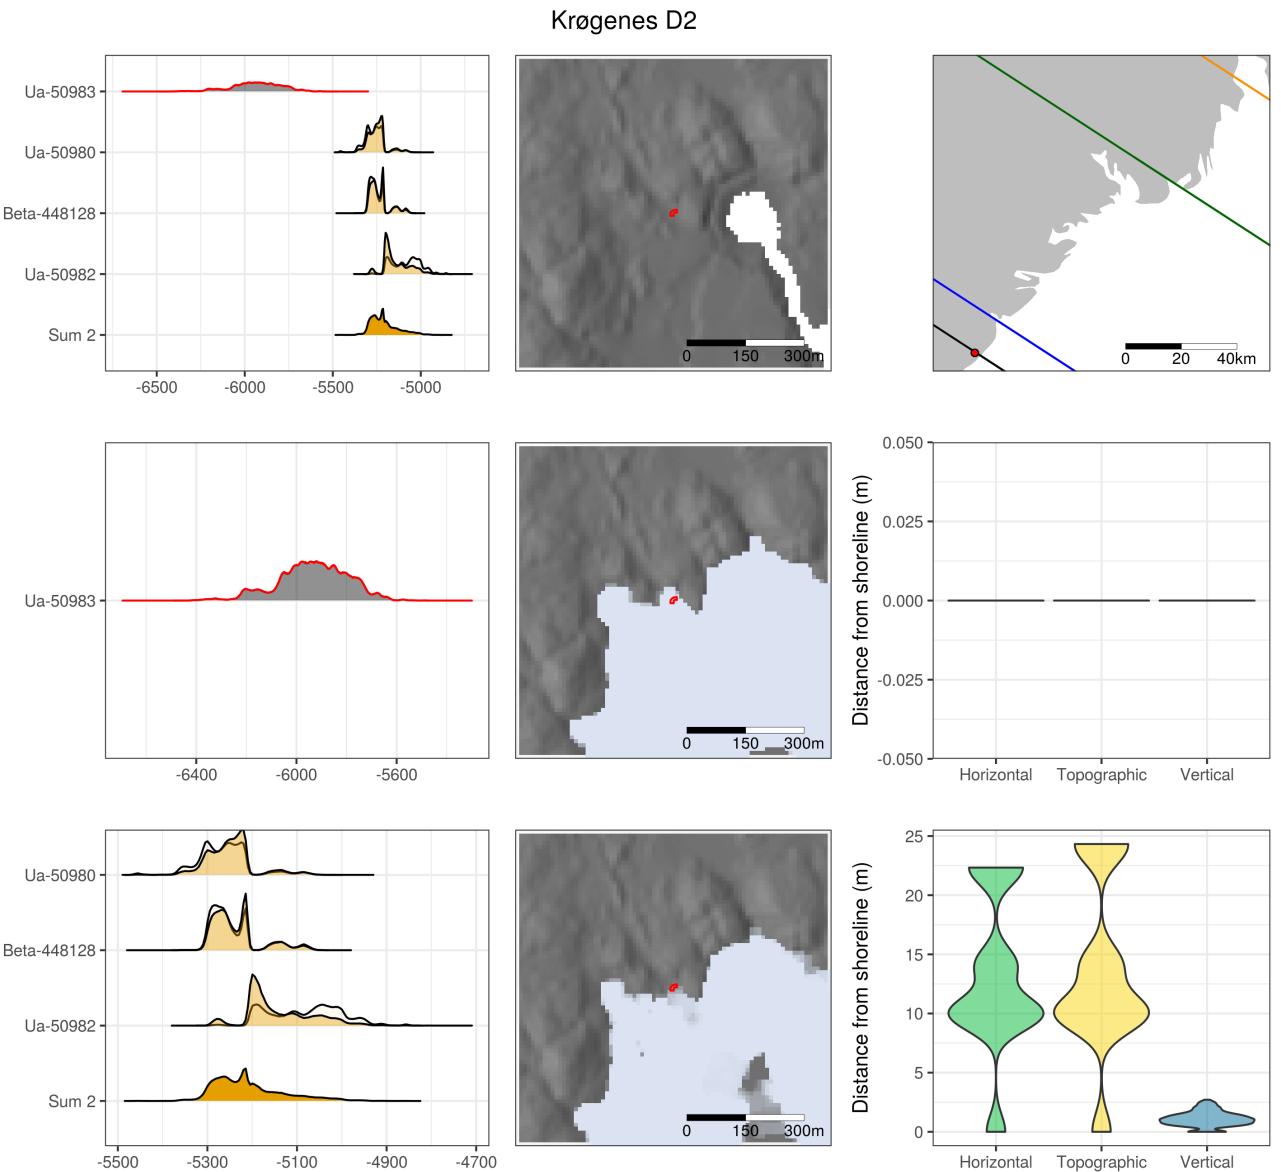

Table 28: Krøgenes D1

ID	$^{14}\text{C}$ BP	Error	Material	Context
Ua-53108	5694	32	Ash ( <i>Fraxinus</i> )	Cooking pit/fireplace (ID 204387)
Ua-53109	5351	31	Pine ( <i>Pinus</i> )	Cooking pit/fireplace (ID 207098)
Ua-53110	5334	31	Pine ( <i>Pinus</i> )	Cooking pit/fireplace (ID 207811)
Ua-53107	5249	31	Birch ( <i>Betula</i> )	Posthole? (ID 204397)
Ua-50979	5082	40	Willow/alder ( <i>Salix/Alnus</i> )	Ditch (ID 204424)
Ua-50977	4883	40	Willow/alder ( <i>Salix/Alnus</i> )	Cooking pit/fireplace (ID 204413)
Ua-53106	4559	31	Pine ( <i>Pinus</i> )	Ditch (ID 203549)
Ua-50978	4005	34	Ash ( <i>Fraxinus</i> )	Cooking pit/fireplace (ID 206352)
Ua-50975	1641	30	Ash ( <i>Fraxinus</i> )	Cooking pit/fireplace (ID 203533)

All  $^{14}\text{C}$ -dates from Krøgenes D1 are believed to be related to use of the site, which has been reused multiple times over a long time-span (Reitan and Solberg 2018a). This is evidenced by the artefact inventory as well. To what degree the different dates are related to different or the same settlement phases is difficult to ascertain, but is here, as with for the rest of the sites, simply based on grouping dates overlapping with 99.7% probability. The site is situated around 100 meter from a road to the south, but this does not appear to impact simulation results, which is therefore left unedited in the DTM.

Table 29: Krøgenes D2

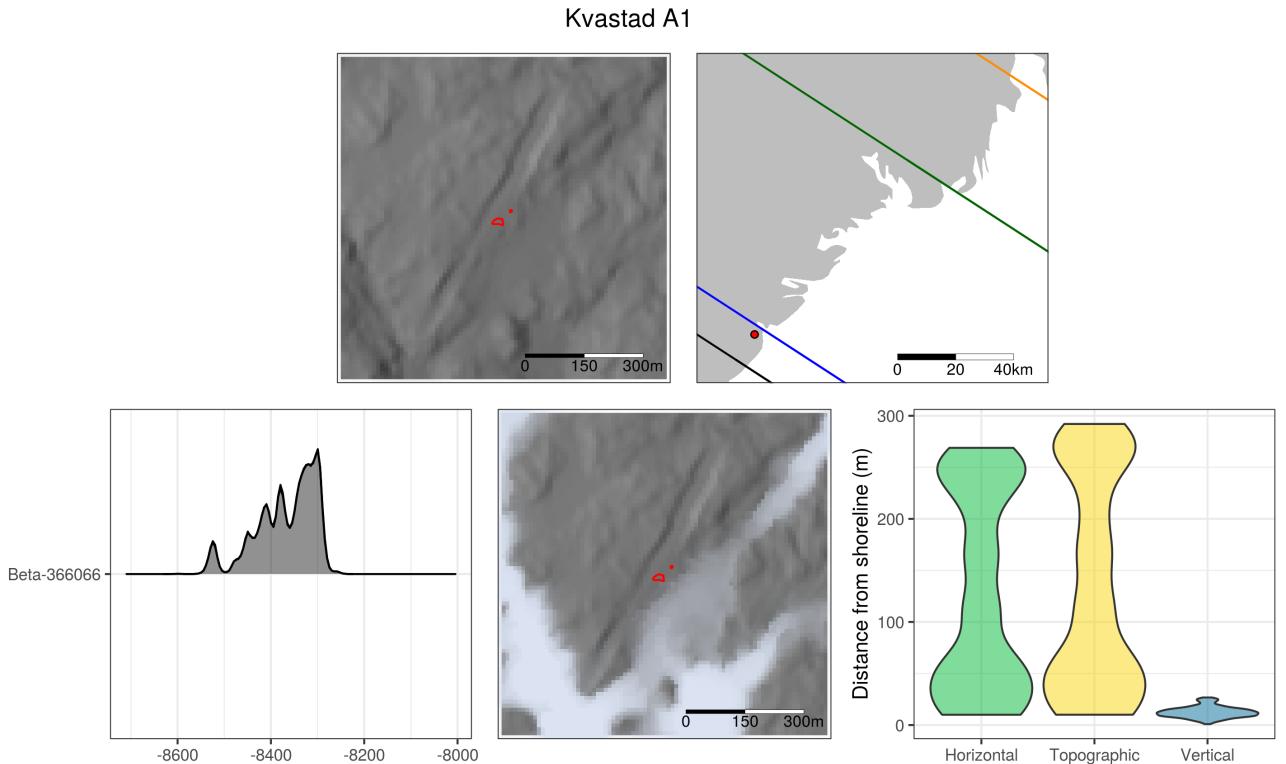

ID	$^{14}\text{C}$ BP	Error	Material	Context
Ua-50983	7059	143	Pine ( <i>Pinus</i> )	Stone packing (ID 206735)
Ua-50982	6132	45	Pine ( <i>Pinus</i> )	Cultural layer (ID 206712)
Beta-448128	6260	30	Alder ( <i>Alnus</i> )	Cultural layer (K2, sample ID 3102)
Ua-50980	6297	44	Pine ( <i>Pinus</i> )	Cultural layer (ID 206712)
Ua-50981	3379	34	Birch ( <i>Betula</i> )	Sand layer (ID 206652)
Beta-448127	1760	30	Hazel ( <i>Corylus</i> )	Cultural/Cultivation layer (K1, sample ID 3646)

Dates match the artefact inventory of Krøgenes D2, with the exception of the oldest date which is not seen as relevant for the main occupation of the site, in part also due to the large error (Mansrud et al. 2018). The site location is similar to that of Krøgenes D1 (above), and did not require any editing of the DTM.

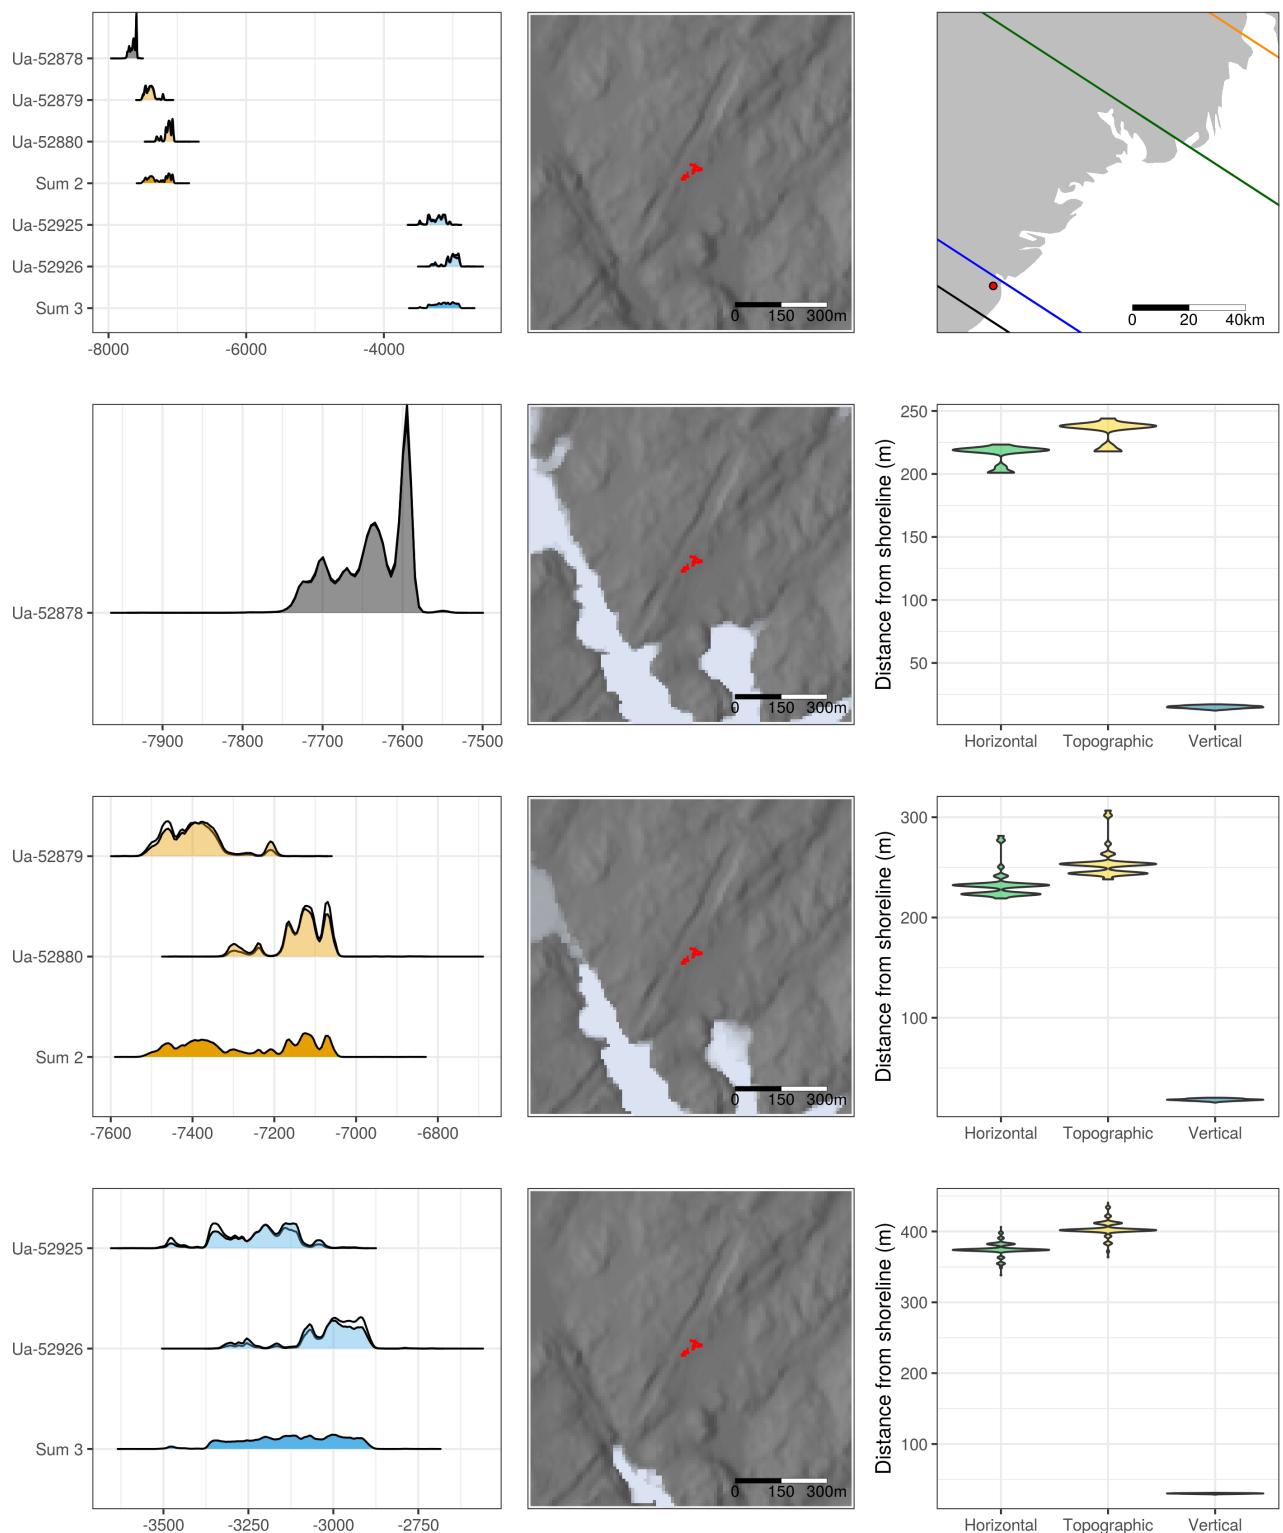

Table 30: Kvastad A1

ID	$^{14}\text{C}$ BP	Error	Material	Context
Ua-53920	2400	30	Yew ( <i>Taxus</i> )	Fireplace (ID 1108)
Ua-53921	2388	29	Indet.	Fireplace (ID 1108)
Ua-53918	2249	29	Alder ( <i>Alnus</i> )	Fireplace (ID 1108)
Ua-53917	2176	29	Birch ( <i>Betula</i> )	Fireplace (ID 1108)
Ua-53919	2164	29	Indet.	Fireplace (ID 1108)
Ua-52872	2264	27	Birch ( <i>Betula</i> )	Fireplace (ID 1108)
Beta-366066	9150	40	Pine ( <i>Pinus</i> )	Test pit (ID 20993)

$^{14}\text{C}$ -date and lithic inventory at Kvastad A1 correspond with a date to the end of the Early Mesolithic (Stokke et al. 2018). The highway to north of the site is clearly visible on the DTM, but does not impact the simulation results.

### Kvastad A2

The two find areas at Kvastad A2 are predominantly Mesolithic (to the south-west) and Neolithic (to the north-east) but were treated in combination here as one Mesolithic date was from the Neolithic area (Stokke

Table 31: Kvastad A2

ID	<sup>14</sup> C BP	Error	Material	Context
Ua-52878	8625	35	Pine (Pinus)	Fireplace (ID 57753)

Ua-52874	3431	28	Oat ( <i>Avena</i> sp.)	Cultivation layer (ID 53485)

Table 32: Kvastad A4

ID	<sup>14</sup> C BP	Error	Material	Context
Ua-52887	2395	27	Ash ( <i>Fraxinus</i> )	Cooking pit (ID 153273)
Ua-52882	809	26	Oak ( <i>Quercus</i> )	Fireplace (ID 150637)
Ua-52886	1100	26	Pine (Pinus)	Trench profile (ID 153311)
Beta-366067	8760	40		Test pit (ID 21410)

and Reitan 2018a). There is also a late Neolithic element in the lithic inventory that is not reflected in the <sup>14</sup>C-dates. As with Kvastad A1 (above) the highway runs north of the site, clearly visible on the DTM, but does not impact the simulation results.

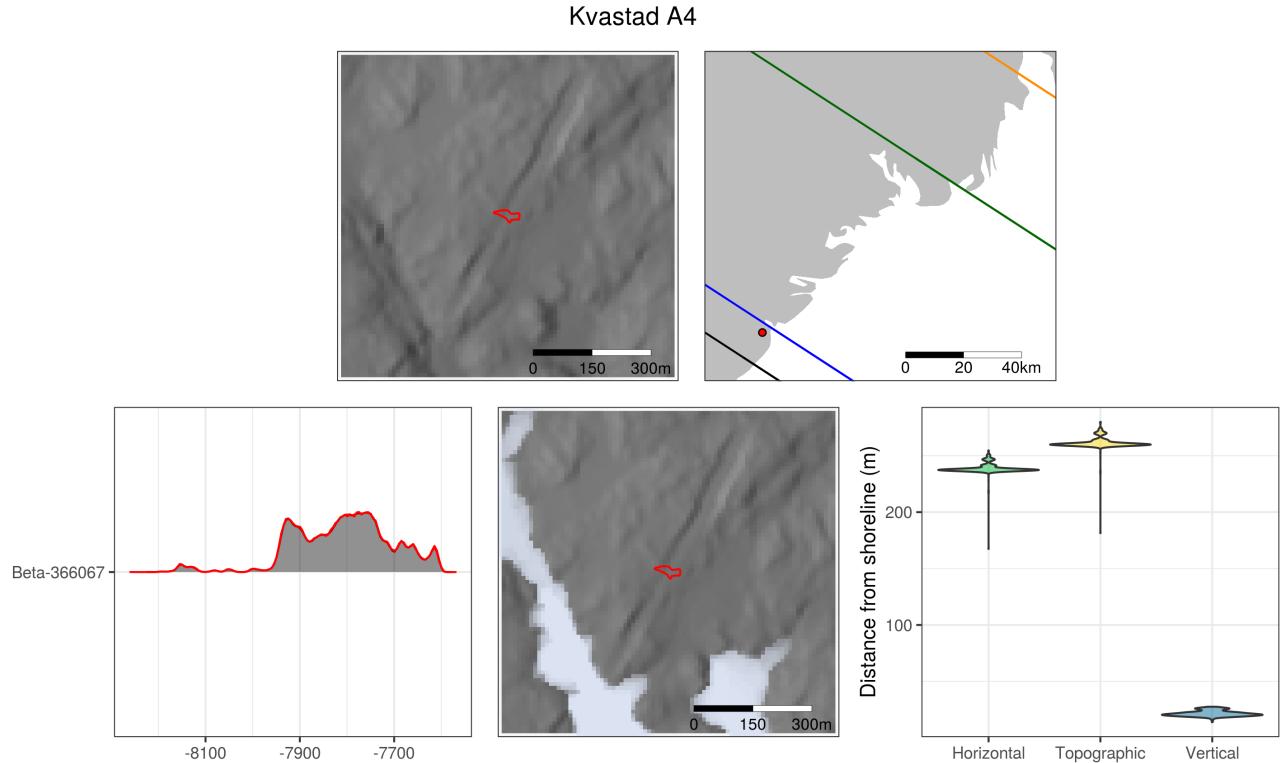

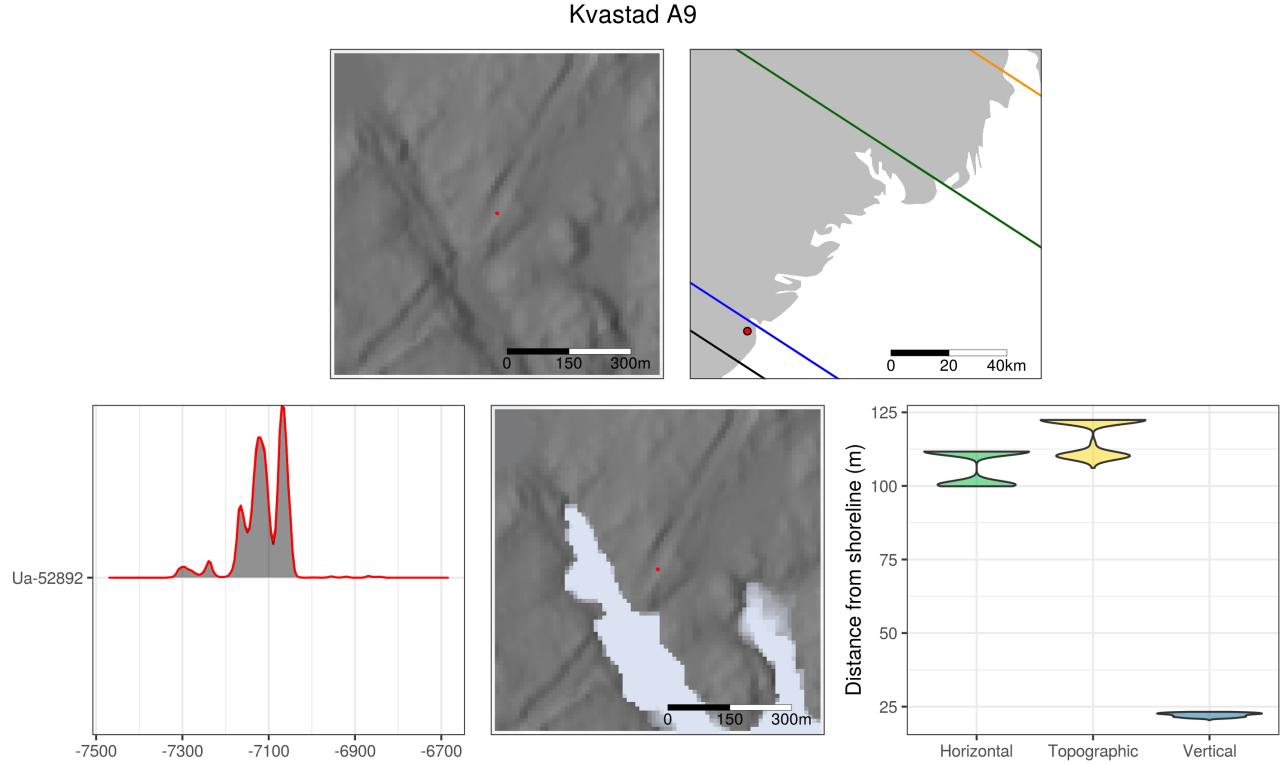

Table 33: Kvastad A9

ID	$^{14}\text{C}$ BP	Error	Material	Context
Ua-52891	2476	27	Oak ( <i>Quercus</i> )	Fireplace (ID 400076)
Ua-52892	8119	34	Pine ( <i>Pinus</i> )	Stone packing (ID 400159)
Ua-52893	3187	28	Pine ( <i>Pinus</i> )	Fireplace (ID 400180)

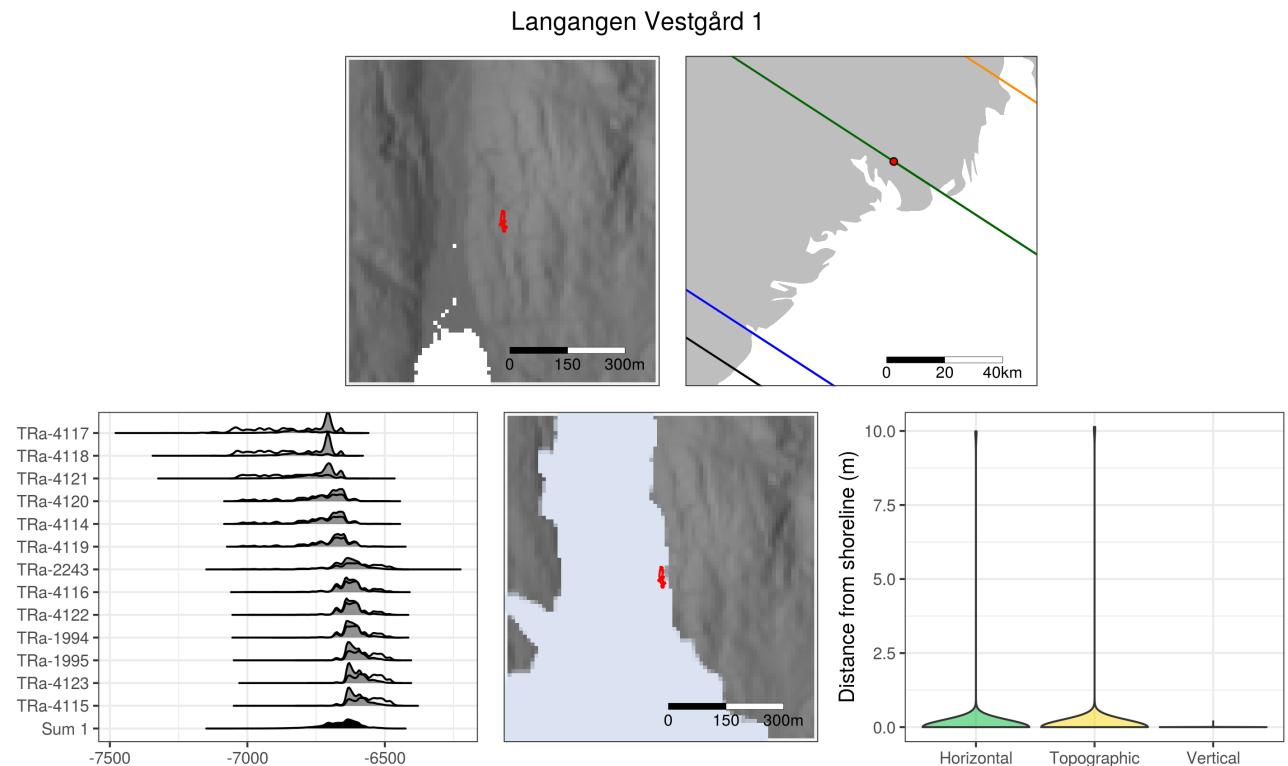

While there are a few elements of the lithic inventory from Kvastad A4 that could be related to the late Middle Mesolithic  $^{14}\text{C}$ -date, it is not related to the main visits to the site, which are Early Mesolithic in character (Darmark et al. 2018). The highway runs over the site today, but this is not relevant for the shore-line reconstruction done here.

The Stone Age date from Kvastad A9 is not related to the Early Mesolithic assemblage (Darmark 2018a). The highway running by the site does not seem relevant to the simulation results.

Table 34: Langangen Vestgård 1

main text). No editing of the DTM was necessary.

Langangen Vestgård 5. Typology match the  $^{14}\text{C}$ -dates and a division into two settlement phases, one Late Mesolithic and one Early Neolithic (Reitan 2014c). No editing of the DTM deemed necessary.

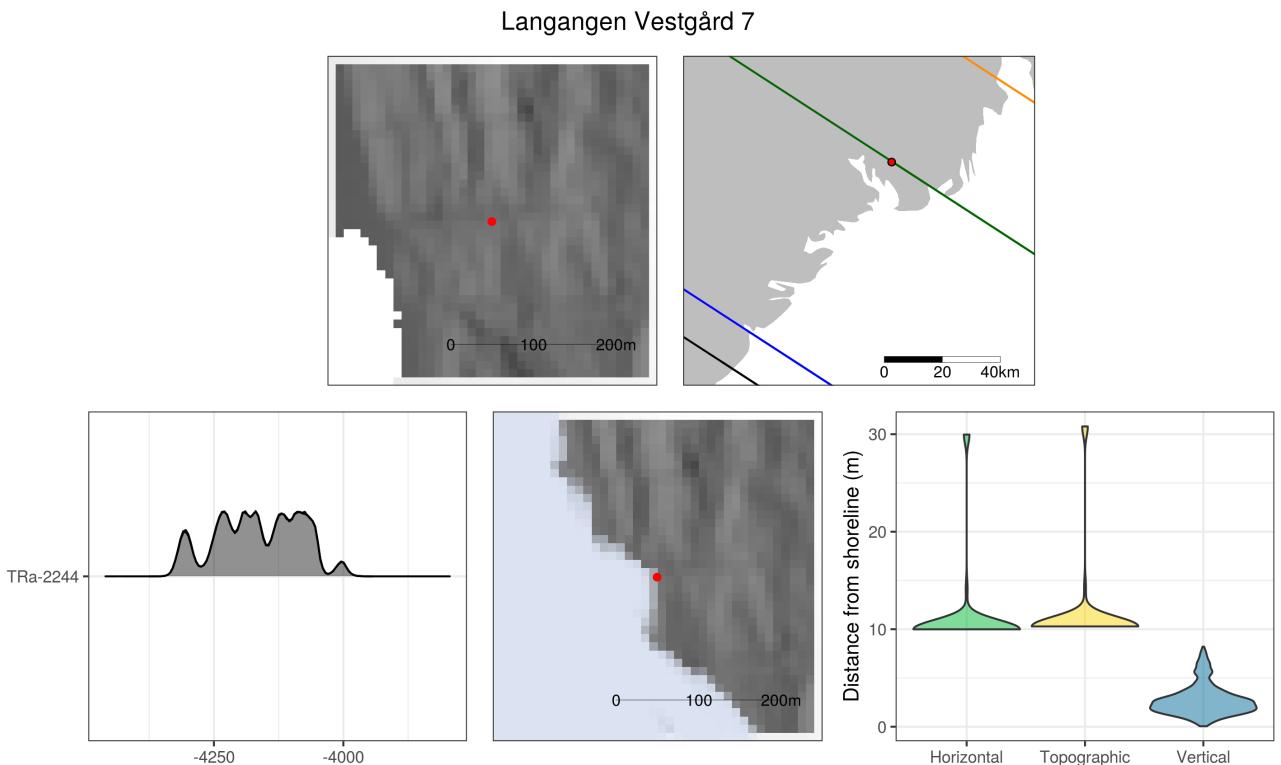

Pottery and the lithic inventory of Langangen Vestgård 6 match  $^{14}\text{C}$ -dates to the Early Neolithic (Reitan 2014d). Nothing in the artefact inventory could be related to the Late Neolithic date. The DTM did not require editing.

ID	$^{14}\text{C}$ BP	Error	Material	Context
TRa-2244	5335	50	Birch/willow (Betula/Salix)	Cooking pit (ID 214)

Langangen Vestgård 7 is represented by a cooking pit found on one of two terraces scattered with lithics that was not known and not originally part of the excavation project (Reitan 2014e). The site was therefore only investigated to a limited degree. However, the material does typologically match the  $^{14}\text{C}$ -date.

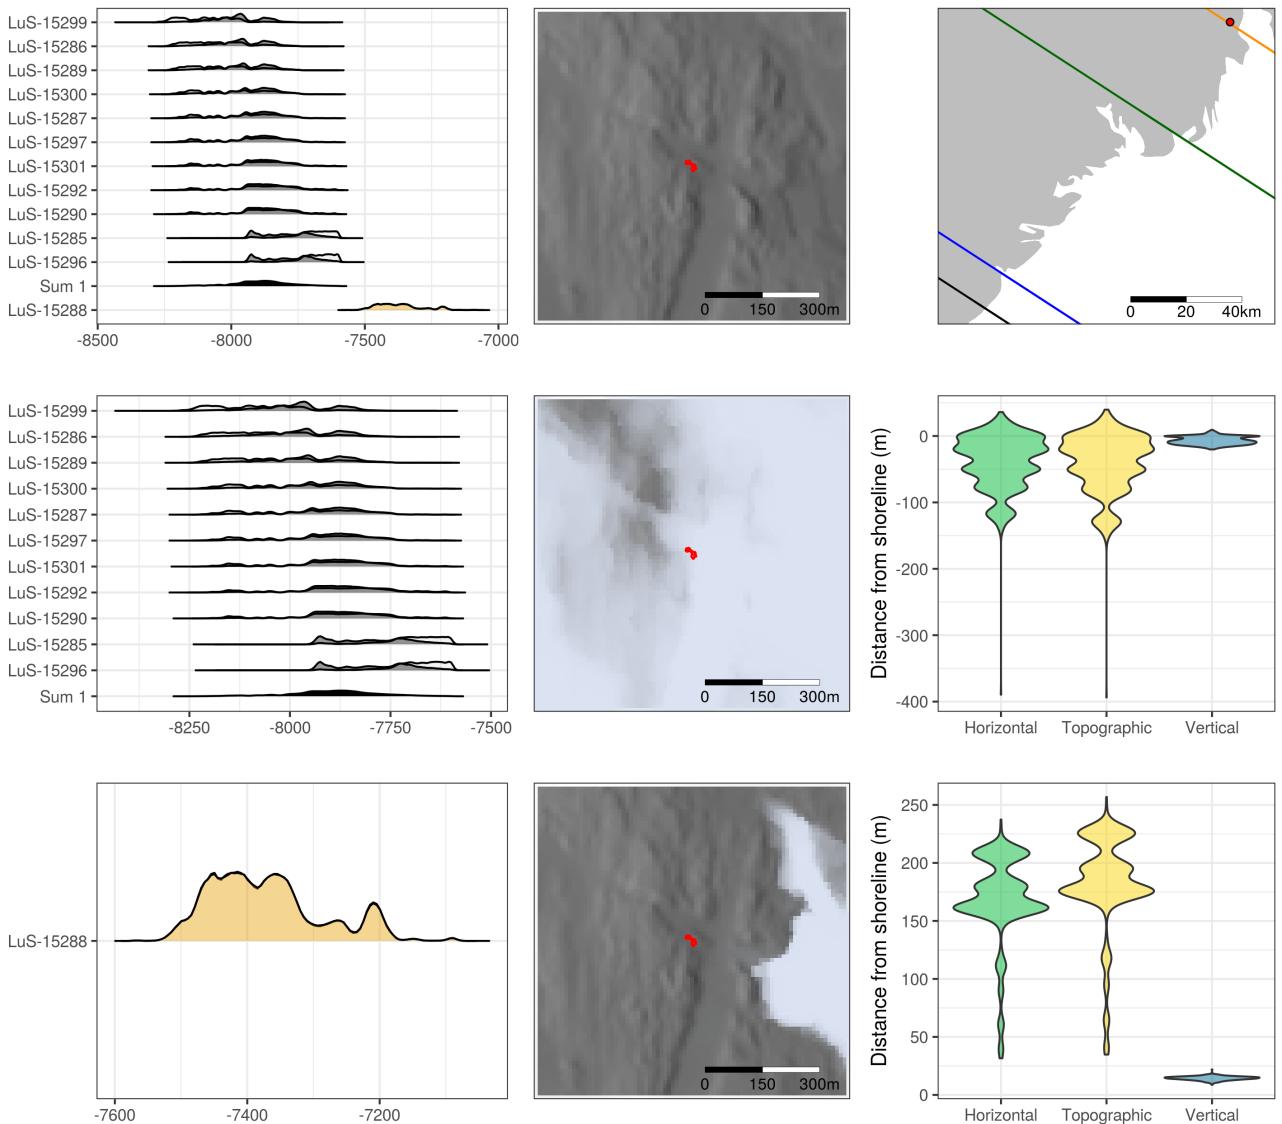

Table 39: Langemyr

ID	$^{14}\text{C}$ BP	Error	Material	Context
Ua-52063	8853	43	Hazel ( <i>Corylus</i> ), nutshell	Quadrant (60x102y, layer 2)

Langemyr is typologically and radiometrically dated to the Middle Mesolithic (Koxvold 2018a). A construction area just south the site was removed. This is the same highway-project and raster editing that was done for some of the Hovland sites above.

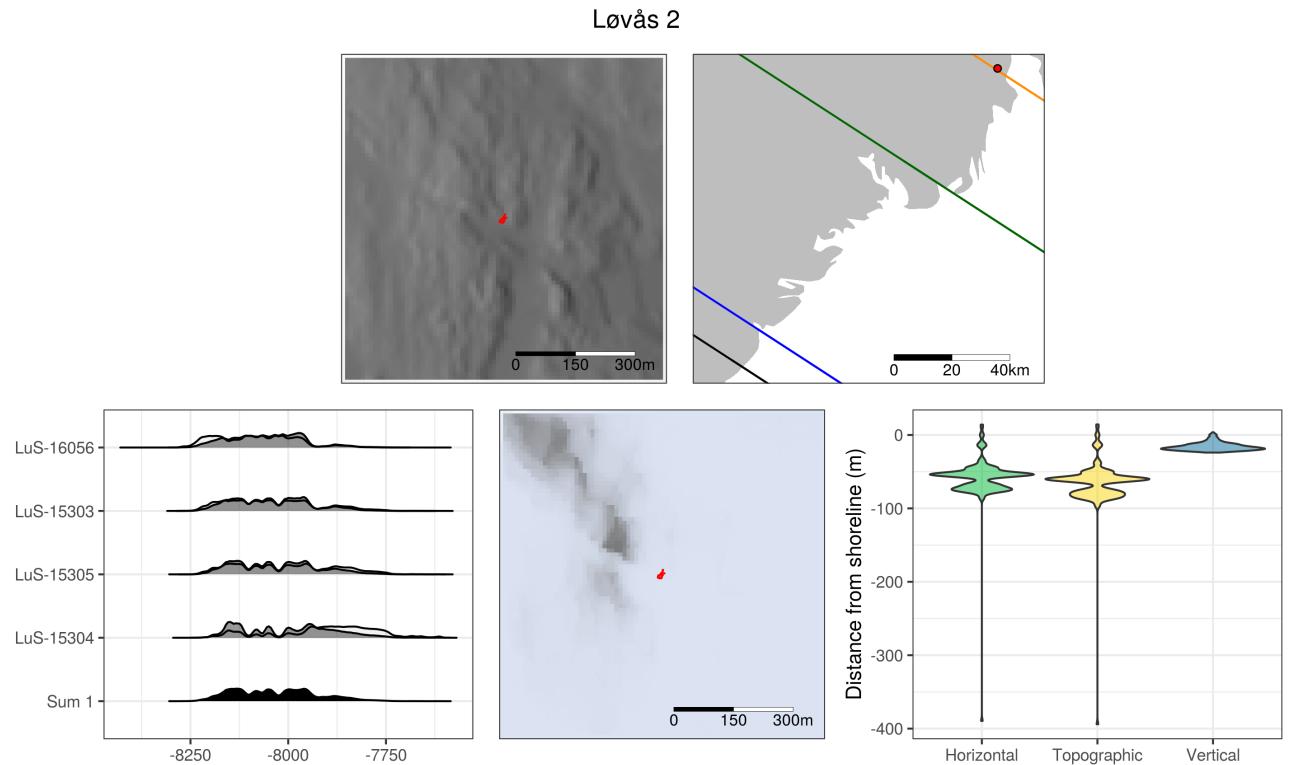

### Løvås 1

The artefact inventory from Løvås 1 matches the radiocarbon dates (Reitan and Hårstad 2022). No editing of the raster appeared to be necessary. Interestingly only the Løvås sites were simulated to be situated beneath the sea-level. The typologically secure inventory combined with the many overlapping dates from various features does indicate that the issue is with the displacement curve and not the dating of the site (see also main text). Similar situation to that on Løvås 2 and 3 (below).

The artefact inventory from Løvås 3 matches the radiocarbon dates (Reitan and Hårstad 2022). Similar setting to that of Løvås 1 and 2 (above).

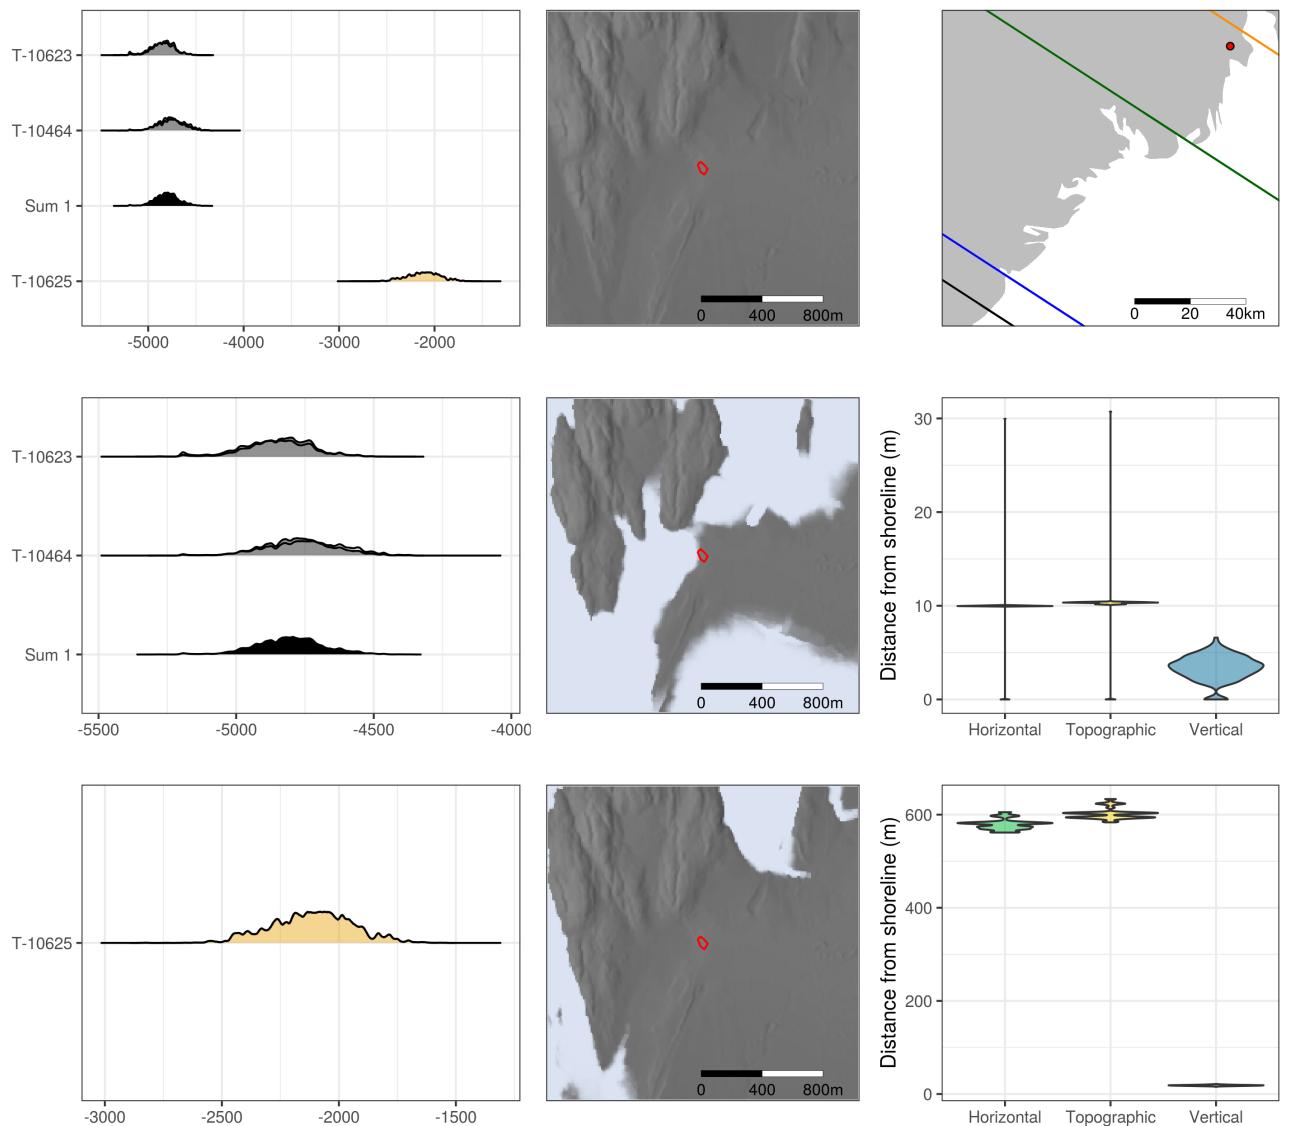

Table 43: Lunaveien

ID	$^{14}\text{C}$ BP	Error	Material	Context
Beta-276197	1430	40	Birch ( <i>Betula</i> )	Square (50x53y, layer 1)
Beta-276198	60	40	Pine ( <i>Pinus</i> )	Square (50x50y, layer 1)
Beta-276199	1690	40	Birch ( <i>Betula</i> )	Square (51x55y, layer 1)
Beta-276200	3620	40	Pine ( <i>Pinus</i> )	Square (53x52y, layer 1)
Beta-278526	2350	40	Burnt bone	Square (50x50y, layer 2)
Beta-278527	2380	40	Burnt bone	Square (51x55y, layer 2)

Lunaveien is a grave cairn site, and the report states that it is unlikely that any of the finds relate to a settlement (Reitan 2010). The results have therefore been excluded from the aggregative analysis.

### Nauen A

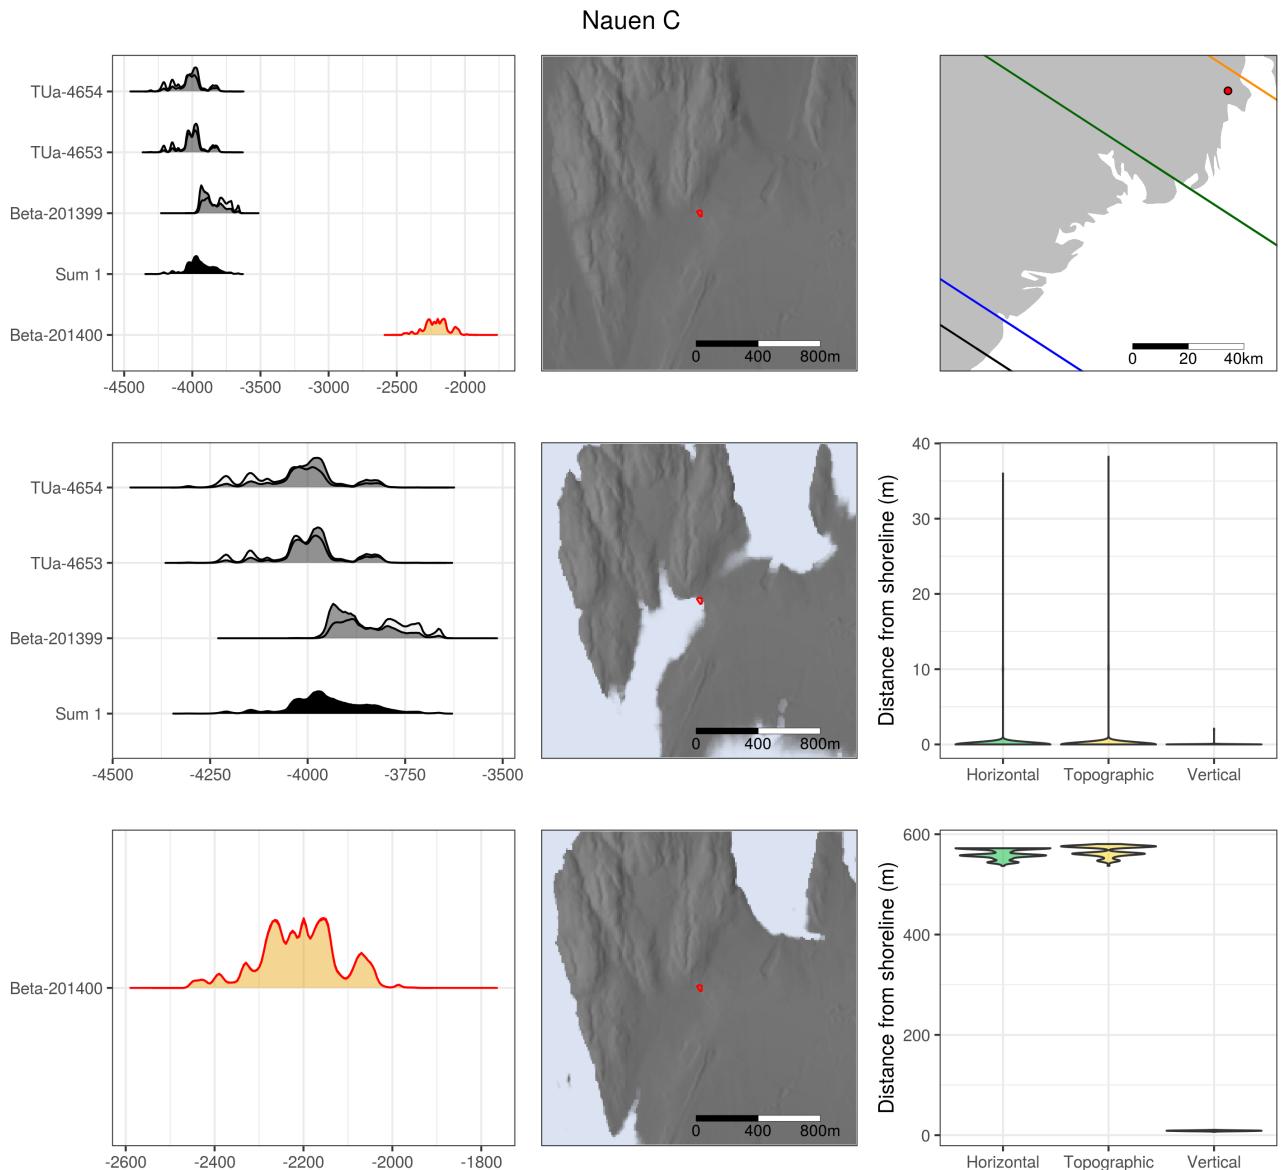

Typology of the lithic inventory on Nauen A points to a Late Mesolithic date (Persson 2008). The later date is seen as related to the establishment of a field for grazing or agriculture, which is also supported by younger dates that fall outside the analysis here. A section of the highway located a few hundred meters to the south was pre-emptively edited in the DTM. This does not appear to be relevant for the simulated sea-level.

Table 44: Nauen A

Nordby 1 is dated to the Late Neolithic, Bronze Age and Early Iron Age (Gjerpe and Bakkemoen 2008a) with long-house 4 dated to the Late Neolithic. Lithics and pottery finds support the  $^{14}\text{C}$ -dates. The site located on what is today a highway which was edited also for Nordby 52 (below), but is not relevant for the

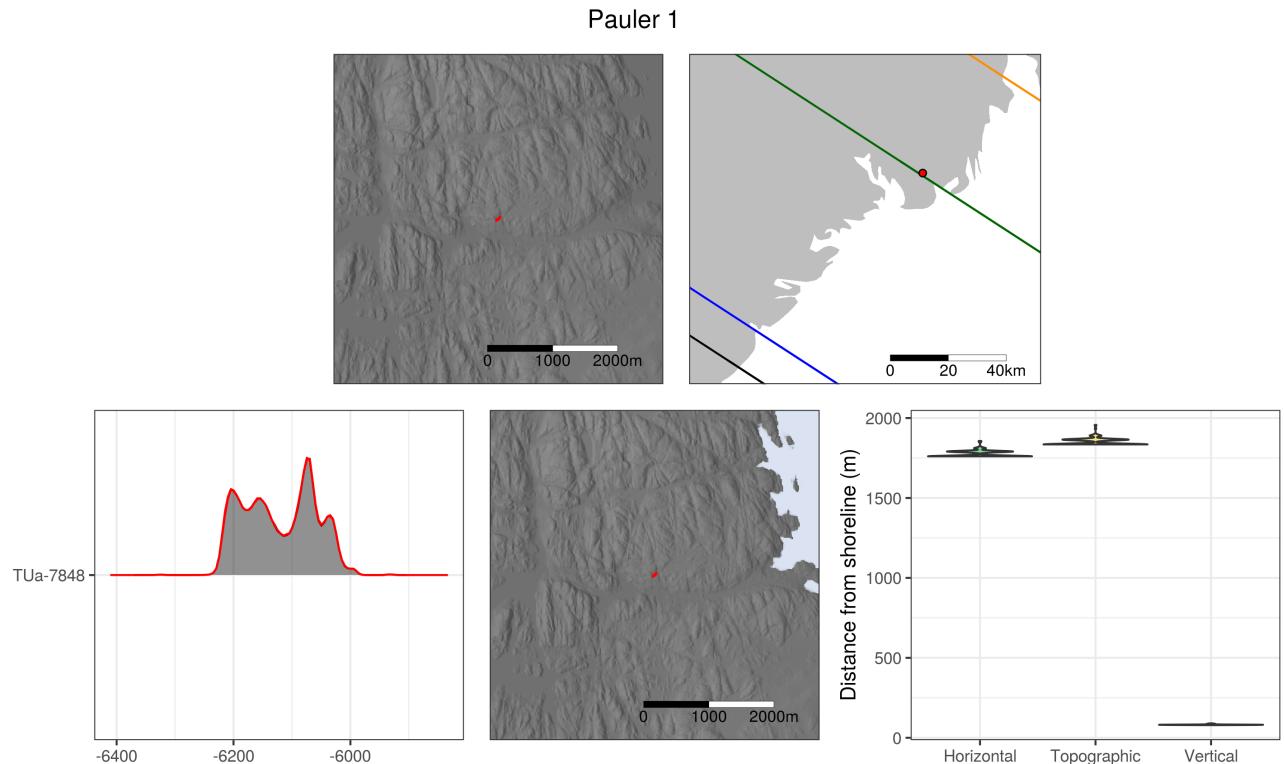

sea-level reconstruction for Nordby 1.

Nordby 52 is a rock-shelter that has been visited throughout prehistory (Gjerpe and Bukkemoen 2008b). The site has a clear typological date to both of the Stone Age periods defined by the  $^{14}\text{C}$ -dates treated here. The site is located by where the highway runs today (see also Nordby 1 above). Edit appears to have been successful.

Ua-45176	8671	45	Hazel (Corylus), nutshell	Square (620x149y, layer 6)
Ua-45177	8620	45	Burnt bone	Square (620x149y, layer 6)
Ua-45178	8593	46	Hazel (Corylus), nutshell	Square (620x149y, layer 8)

by a large gravel pit today, which has been fairly successfully edited. However, as the few negative values in the results are likely to result from the interpolation process and the fact that this is a quite large area, as opposed to issues with the displacement curves or  $^{14}\text{C}$ -dates, the negative values were forced to zero for the aggregative analysis.

Prestemoen 1 has a lithic inventory consistent with the  $^{14}\text{C}$ -dates (Persson 2014a). The site is situated by a gravel pit that is clearly visible on the DTM to the north-east of the site. This was not edited as it has not impacted the simulated distance between site and sea. The landscape surrounding the site would, however, have been very different in the Mesolithic (Persson 2014a:Figure 10.20).

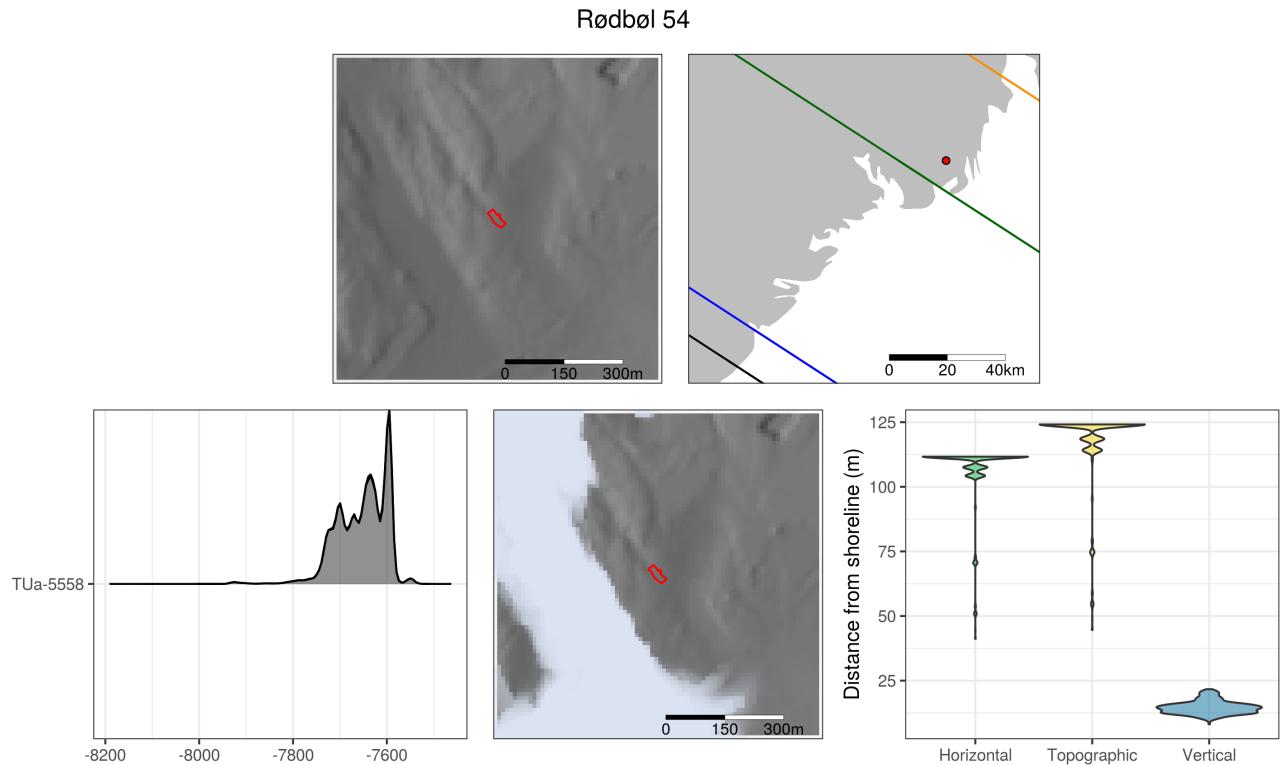

### Ragnhildrød

The earliest  $^{14}\text{C}$ -date, from an uncertain context, is argued to be younger and not match the typological indicators in the inventory from Ragnhildrød (Mjærum 2012:50, 71). The post-hole dated to the Late Neolithic/Bronze Age could be related to a single find of a pressure flaked object, but was not given much weight in the report (Mjærum 2012:76).

The first archaeological finds from Rognlien were done in the 1880s and, following some smaller investigations, was excavated by Ingstad (1970) in 1957. The site limit has been manually defined based on the description given in the publication and the spatial geometry of the site as defined in the database Askeladden. The manually defined limit could be slightly off, but should match the elevation of the site given in the publication (Ingstad 1970:26). The  $^{14}\text{C}$ -dates from the original excavation was not seen as contemporaneous with the

Table 54: Rognlien

lithic material on the site. Burnt elk bone from the original excavation was therefore recently subjected to radiocarbon dating and is believed to match the occupation of the site (pers.comm. Steinar Solheim, also provided in Stokke 2017:24). Given the 0m distance that the older dates give here, however, there does not appear to be grounds on which to reject the older dates based on sea-level change.

$^{14}\text{C}$ -dates from Sagene B1 do not match the Early Mesolithic inventory of the site (Viken 2018c). The wide

Ua-52867	1766	47	Coniferous (Conif. indet.), cone seed scale	Floor layer (ID 451586)

Table 56: Sagene B2

ID	$^{14}\text{C}$ BP	Error	Material	Context
Ua-52870	4946	29	Deciduous (Decid, indet.)	Tree throw (ID 503080)
Beta-411673	2640	30	Pine ( <i>Pinus</i> )	Cooking pit (ID 500001)
Beta-411674	2460	30	Birch ( <i>Betula</i> )	Cooking pit (ID 500001)
Ua-52924	1305	51	Coniferous (Conif. indet.), cone	Tree throw (ID 503080)

discrepancy of the dates from the post-holes also led Viken (2018c) to suggest that these features might actually be non-anthropogenic and that they could instead be related to trees that have grown on the site.

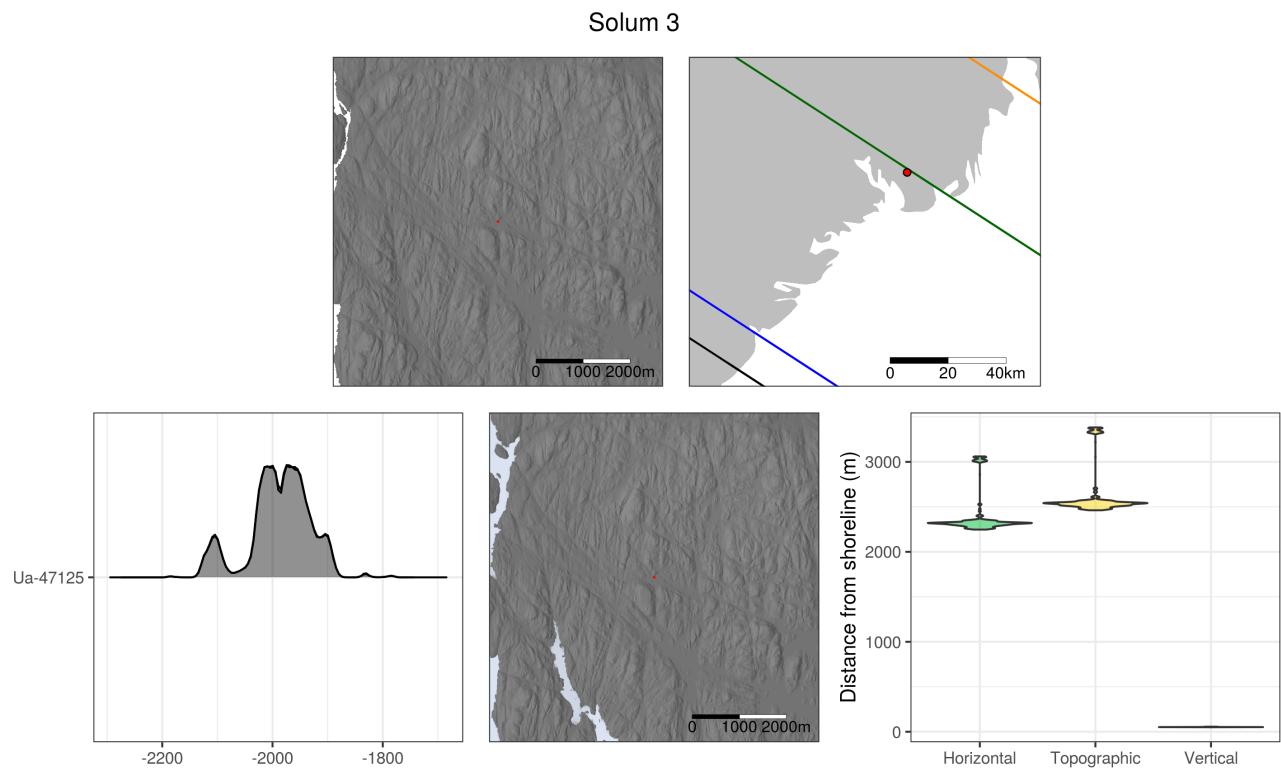

Sagene B2

The  $^{14}\text{C}$ -dates from Sagene B2 do not match the clearly Early Mesolithic inventory of the site (Darmark 2018b).

Table 57: Solum 3

ID	$^{14}\text{C}$ BP	Error	Material	Context
Ua-45179	3039	31	Hazel ( <i>Corylus</i> )	Undefined feature/wooden construction (ID 350)
Ua-47125	3622	34	Burnt bone (1.4g)	Undefined feature/wooden construction (ID 350)

Solum 3 is a Late Neolithic and Early Bronze Age site, with  $^{14}\text{C}$ -dates matching the lithic inventory (Fossum 2014b).

Table 58: Stokke/Polland 1

ID	$^{14}\text{C}$ BP	Error	Material	Context
Ua-48259	5353	101	Hazel ( <i>Corylus</i> )	Cooking pit (ID 22029)
Ua-48260	192	30	Spruce ( <i>Picea</i> )	Charcoal clamp (ID 18176/22964)
Ua-48261	88	31	Spruce ( <i>Picea</i> )	Cooking pit (ID 10537)
Ua-48264	4911	39	Elm ( <i>Ulmus</i> )	Cooking pit (ID 18358)
Ua-48263	1514	30	Birch ( <i>Betula</i> )	Undefined feature (ID 21259)
Ua-48262	4583	38	Willow ( <i>Salix</i> )	Cooking pit (ID 22994)
Ua-48265	4667	39	Hazel ( <i>Corylus</i> )	Undefined feature (ID 21238)
Ua-48266	1549	30	Birch ( <i>Betula</i> )	Undefined feature (ID 15546)
Beta-359783	2960	30	Hazel ( <i>Corylus</i> ), nutshell	Tree throw (ID 1568)

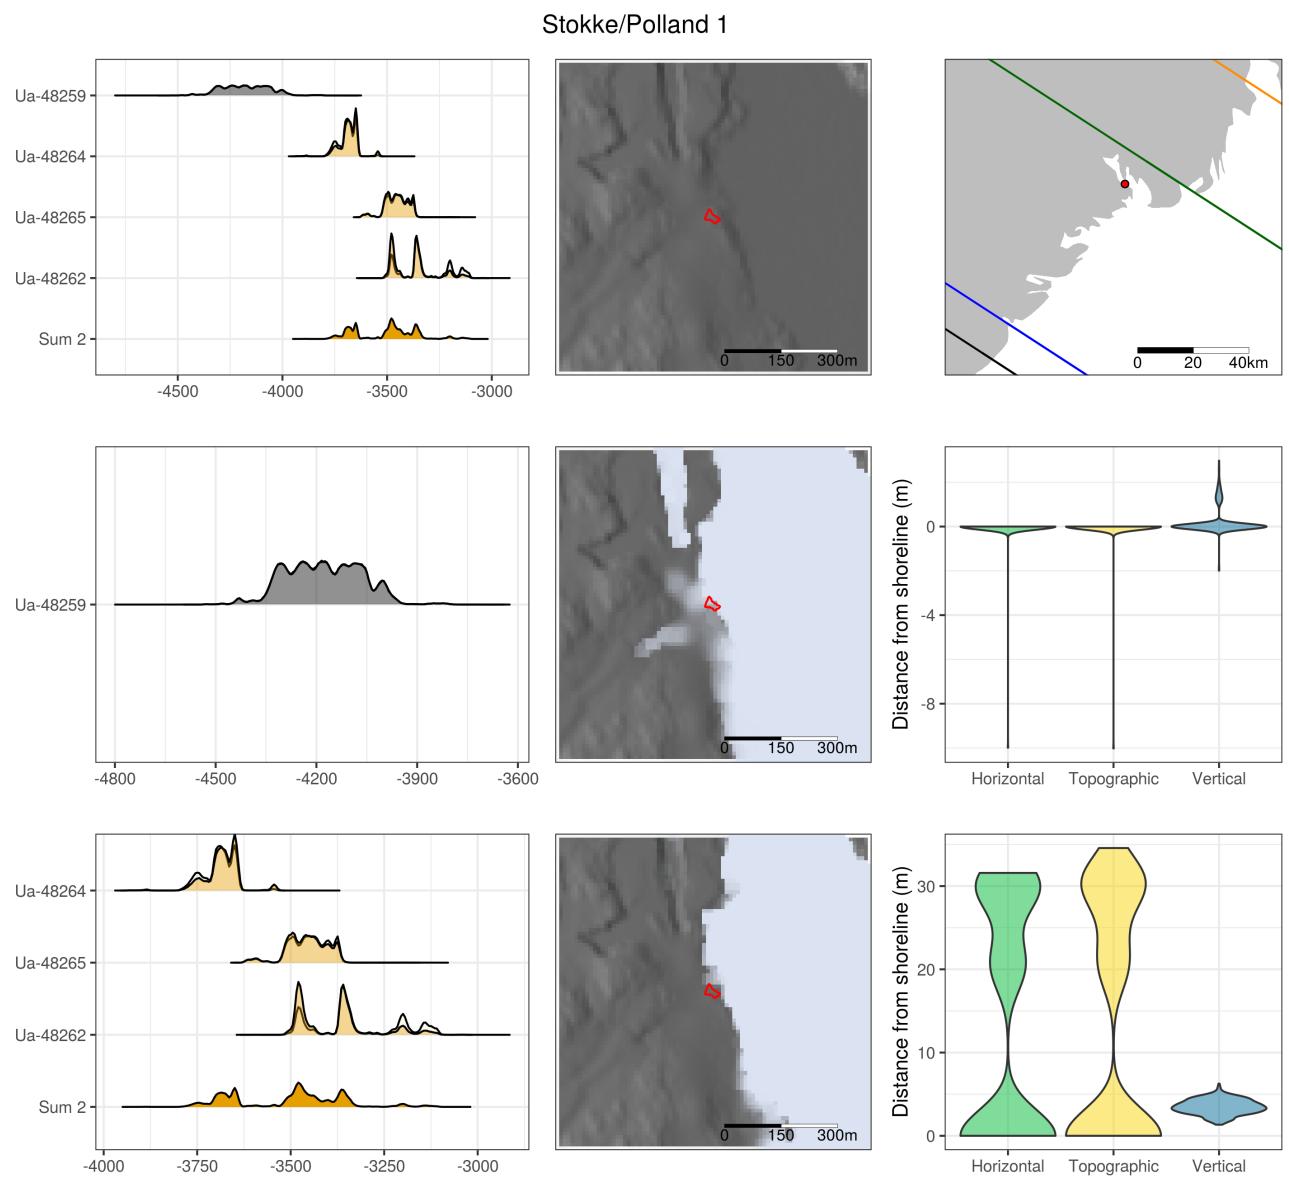

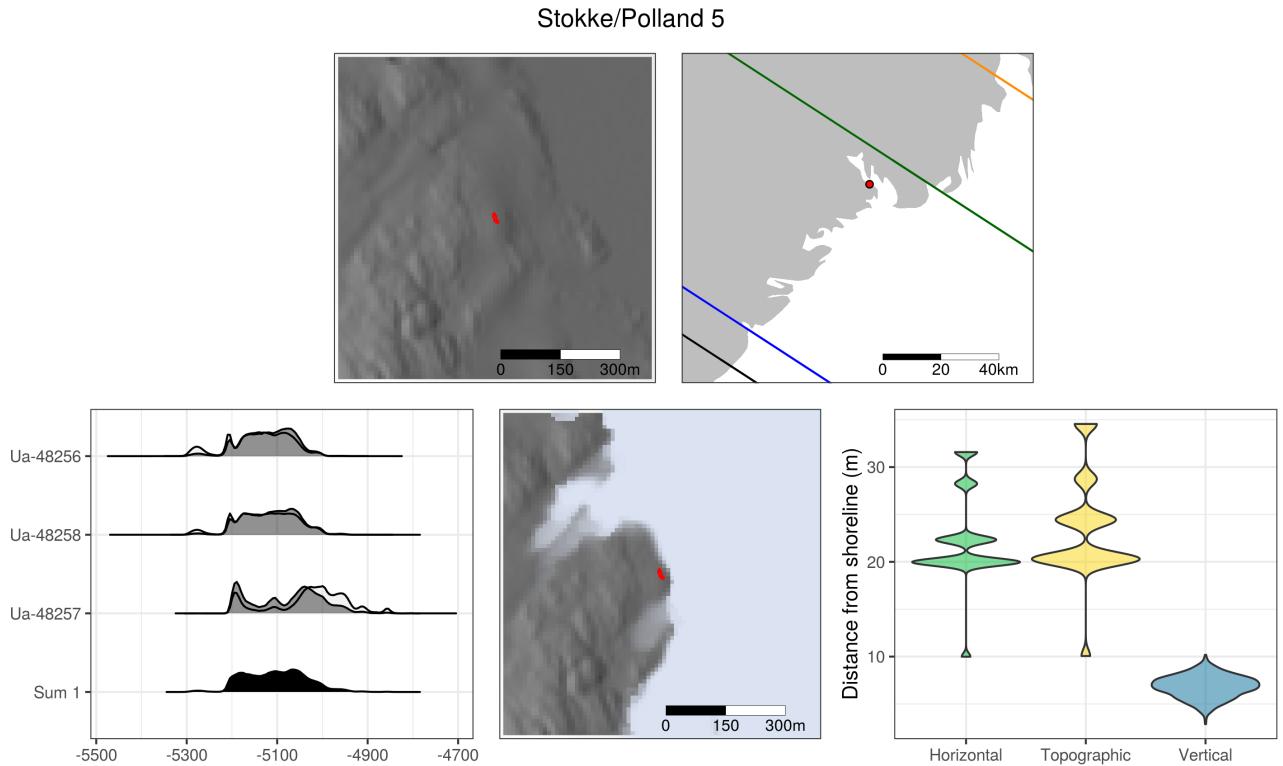

Table 59: Stokke/Polland 5

ID	$^{14}\text{C}$ BP	Error	Material	Context
Ua-48256	6196	40	Alder ( <i>Alnus</i> )	Cooking pit (ID 20345)
Ua-48257	6098	40	Pomoideae ( <i>Malinae</i> )	Cooking pit (ID 20289)
Ua-48258	6177	42	Hazel ( <i>Corylus</i> )	Cooking pit (ID 20270)

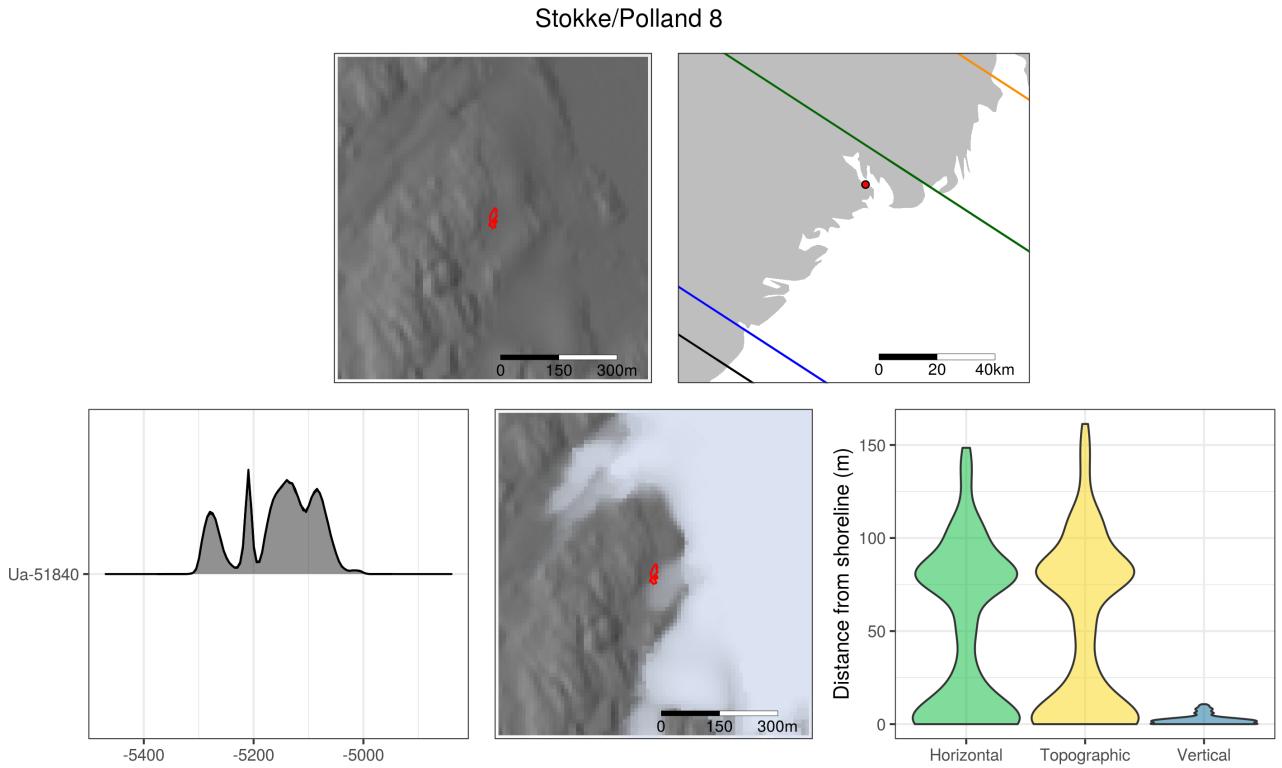

The artefact inventory from Stokke/Polland 1, containing both lithics and ceramics, indicates visits in the Late Mesolithic as well as the Early Neolithic (Koxvold 2017b). Date groups were therefore manually separated, even though they overlap at 99.7% probability. The site is located right by the highway to the east, which was edited for the other Stokke/Polland sites, but this does not appear relevant for the reconstruction of the sea-level at Stokke/Polland 1, which would have reached the site from the west.

The  $^{14}\text{C}$ -dates matches the lithic inventory from Stokke/Polland 5 (Mansrud 2017). The site is located where the highway runs today. This appears to have been successfully edited. The excavated area is more extensive (field A-C in the report) than what is used as the site limit here, but the relation between the different areas is not clear. Field A, used as the site limit here, holds all the dated features.

Table 60: Stokke/Polland 8

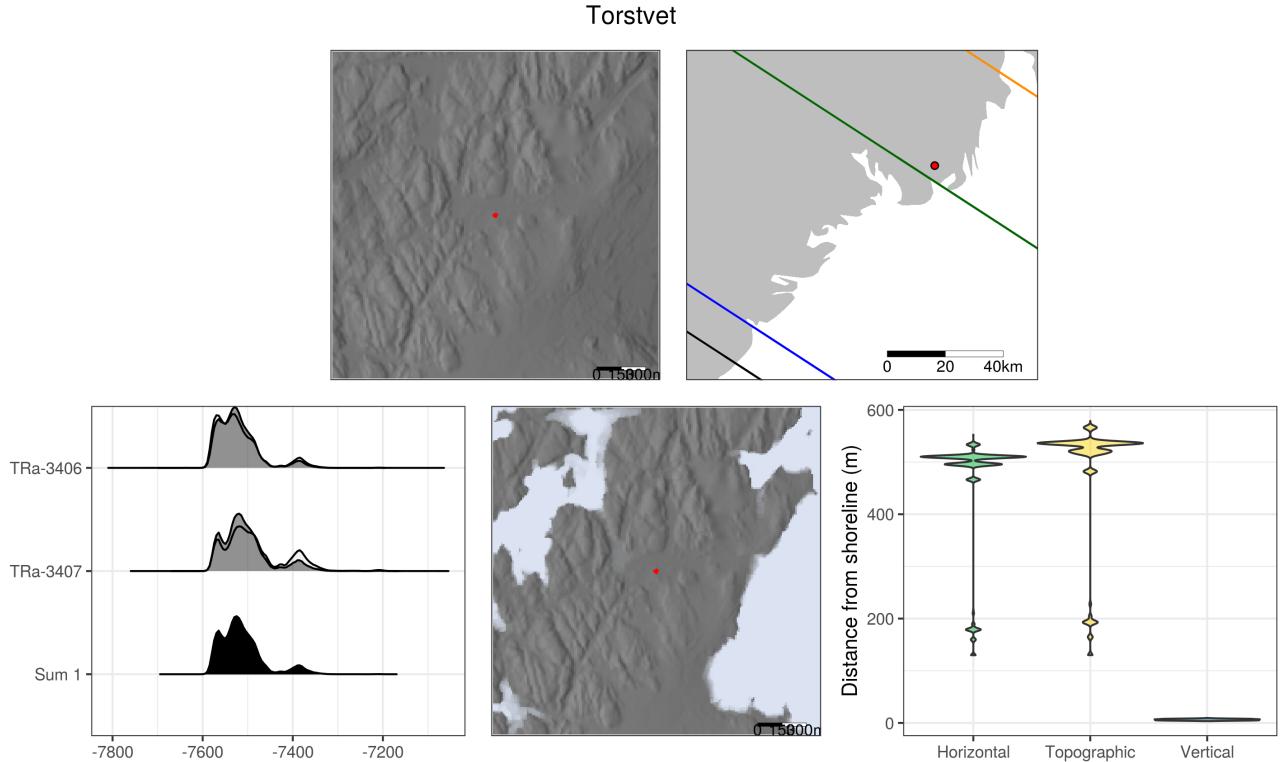

ID	$^{14}\text{C}$ BP	Error	Material	Context
Ua-51840	6215	35	Birch (Betula)	Cooking pit/fireplace (ID 24210)

Stokke/Polland 8 have corresponding lithic inventory and  $^{14}\text{C}$ -date (Fossum 2017c). The site is situated just east of where the highway runs today. This appears to have been successfully edited (cf. Fossum 2017c:Figure 28.3).

Table 61: Torstvet

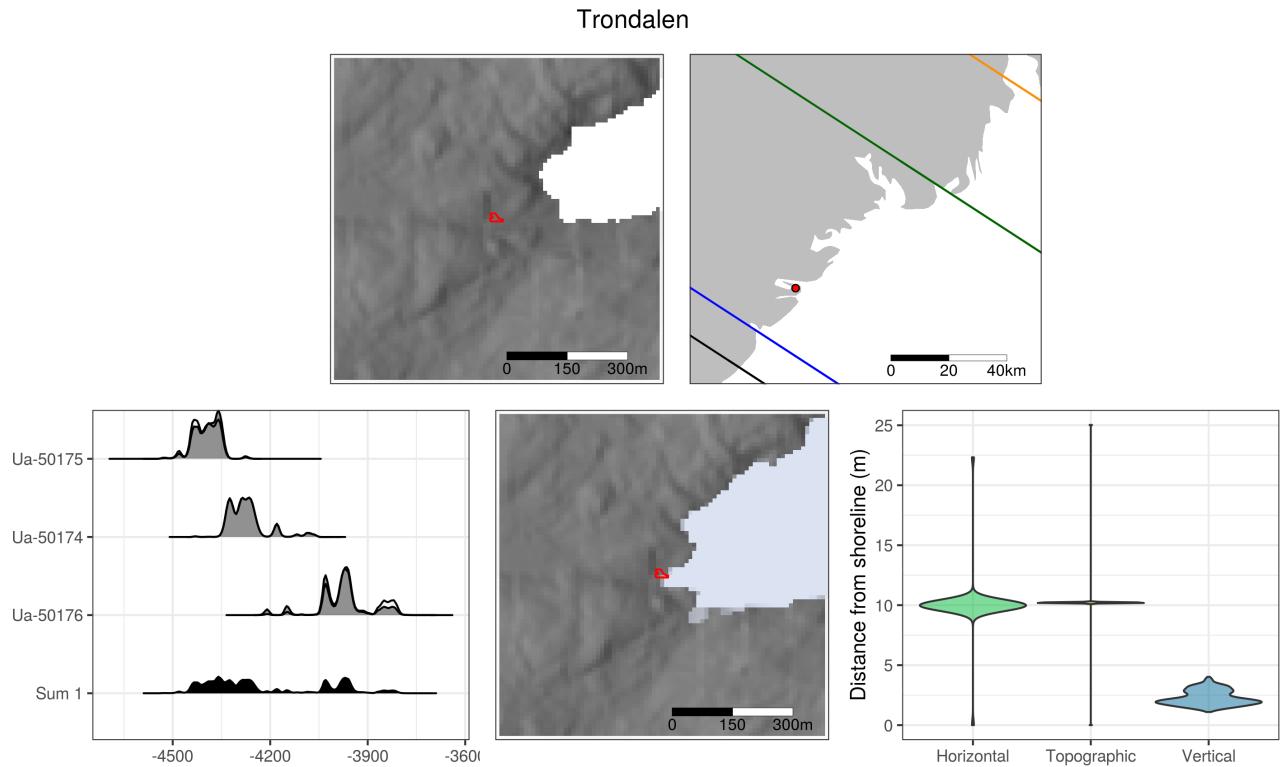

ID	$^{14}\text{C}$ BP	Error	Material	Context
TRa-3406	8460	55	Hazel ( <i>Corylus</i> ), nutshell	Square (61x101y, layer 2)
TRa-3407	8425	55	Hazel ( <i>Corylus</i> ), nutshell	Square (61x102y, layer 2)
Ua-45677	2218	34	Birch ( <i>Betula</i> )	Fireplace (ID 1)
TRa-3405	3090	30	Birch/willow ( <i>Betula/Salix</i> )	Fireplace (ID 1)

Typology of lithics match the  $^{14}\text{C}$ -dates from Torstvet (Mansrud 2013b). The site is located where the highway runs today. This appears to have been successfully edited, although there is a possibility that this has led to the sea-level being simulated slightly further away from the site than what would otherwise have been the case. However, as with the Hovland sites above, this appears to rather follow from the general topography of the landscape characterised by a low relief which makes the reconstruction more uncertain.

Table 62: Trondalen

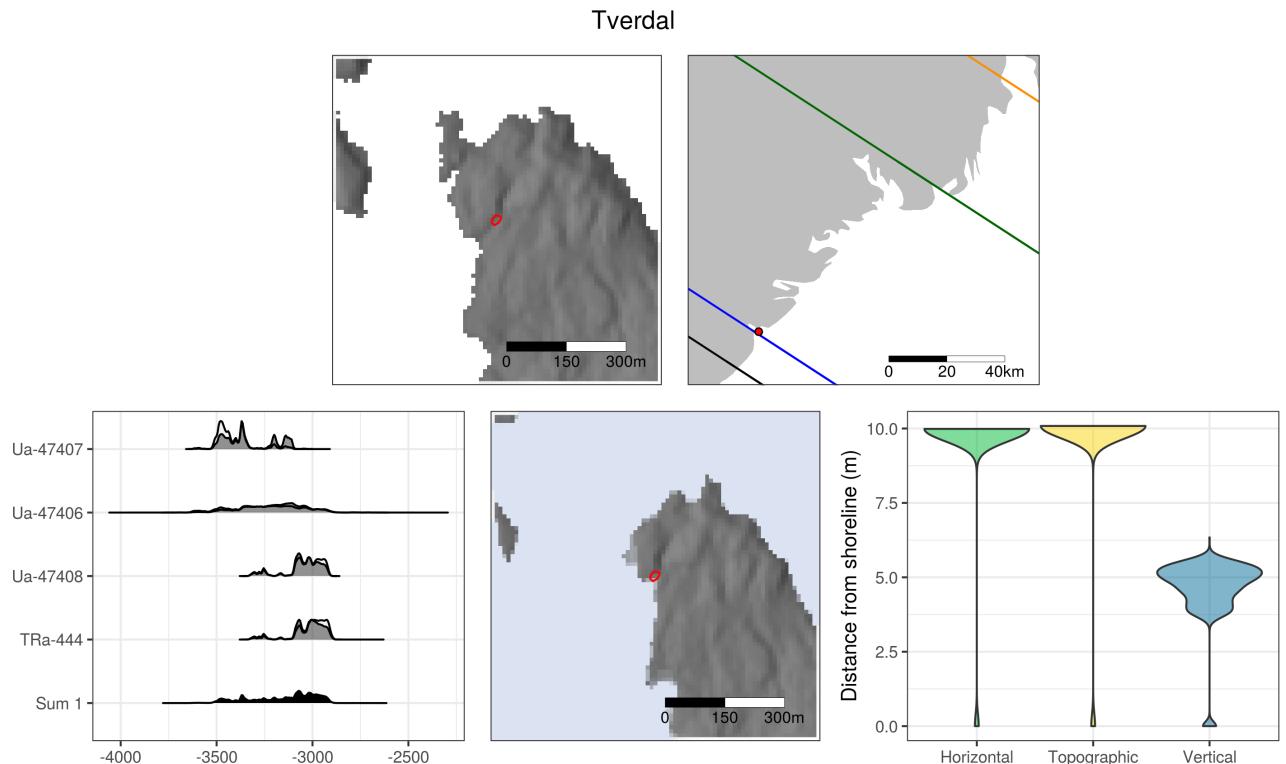

ID	$^{14}\text{C}$ BP	Error	Material	Context
Ua-50174	5425	42	Hazel ( <i>Corylus</i> )	Fireplace (ID 2)
Ua-50175	5557	43	Alder ( <i>Alnus</i> )	Fireplace (ID 3)
Ua-50176	5156	44	Willow ( <i>Salix</i> )	Cooking pit (ID 7)

$^{14}\text{C}$ -dates match the typological indicators in the artefact assemblage at Trondalen (Mansrud 2018). No disturbances required editing in the DTM.

Table 63: Tverdal

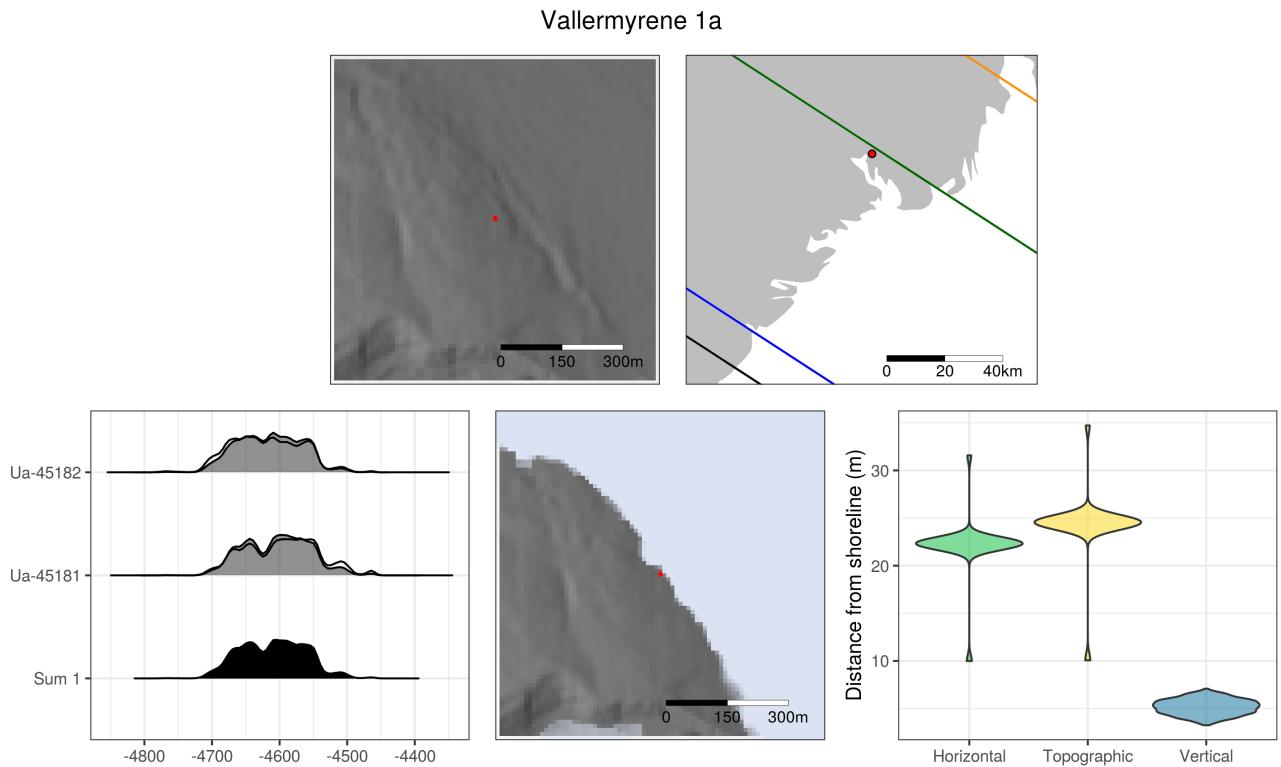

ID	$^{14}\text{C}$ BP	Error	Material	Context
TRa-443	2480	35	Yew (Taxus)	Cultural layer, quadrant (16x10ySE)
TRa-444	4370	45	Birch (Betula)	Cultural layer, quadrant (14x10yNW)
TRa-445	2535	30	Birch (Betula)	Cultural layer, quadrant (16x10yNW)
TRa-446	2475	40	Yew (Taxus)	Cultural layer, quadrant (16x10ySW)
Ua-47406	4536	131	Dog (Canis familiaris)	Cultural layer, quadrant (16x10y)
Ua-47407	4622	48	Boar (Sus scrofa)	Cultural layer, quadrant (16x10y)
Ua-47408	4401	36	Mammal (Mammalia)	Cultural layer, quadrant (16x10y)

Tverdal is an unpublished site. Preliminary analysis indicates that radiocarbon dates and typological indicators match. The area surrounding the site appears relatively undisturbed by modern activity.

Table 64: Vallermyrene 1a

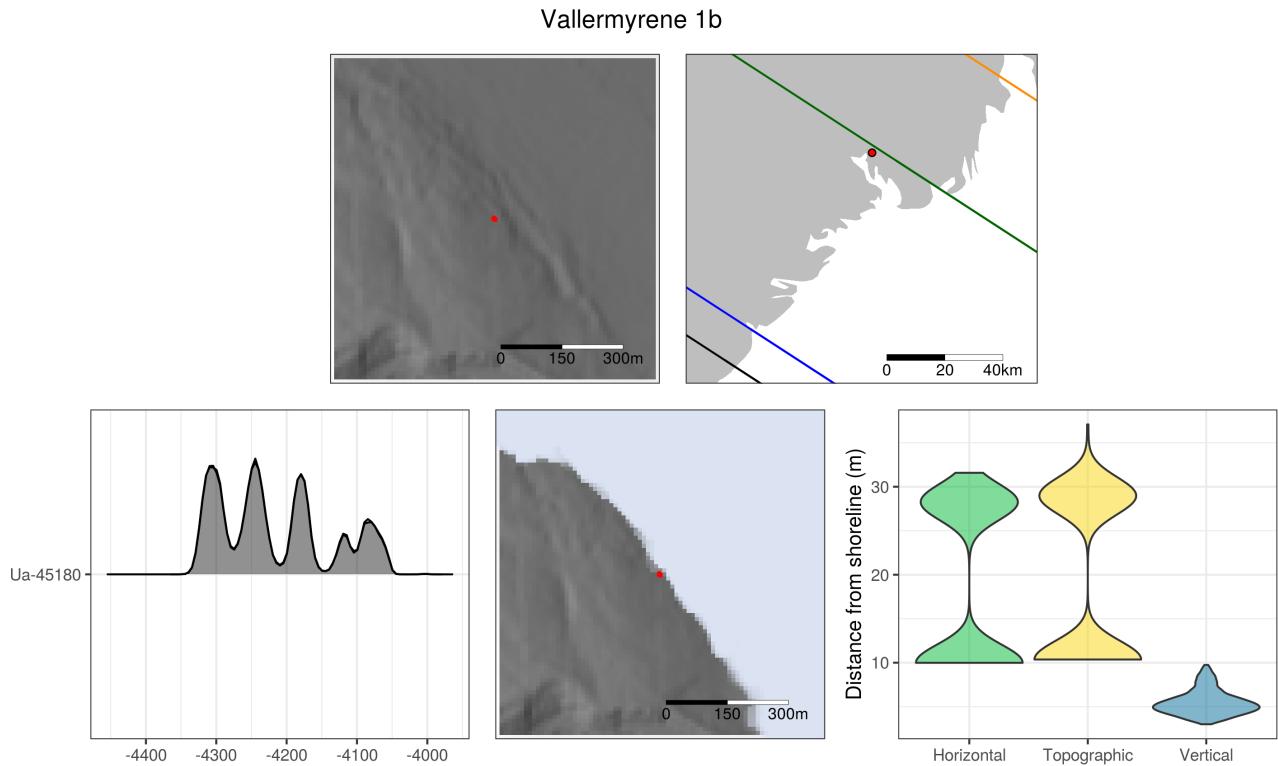

ID	$^{14}\text{C}$ BP	Error	Material	Context
Ua-45182	5770	35	Pine ( <i>Pinus</i> )	Fireplace (ID 322)
Ua-45181	5748	35	Pine ( <i>Pinus</i> )	Cooking pit/fireplace (ID 301)

Vallermyrene 1 was divided into 1a and 1b based on elevation difference, typology and  $^{14}\text{C}$ -dates (Reitan 2014f). Vallermyrene 1a is the oldest of the two. Although situated not that far from the railway, the area immediately surrounding the site has not been disturbed in a way that appears to impact the reconstruction of the past sea-level.

Table 65: Vallermyrene 1b

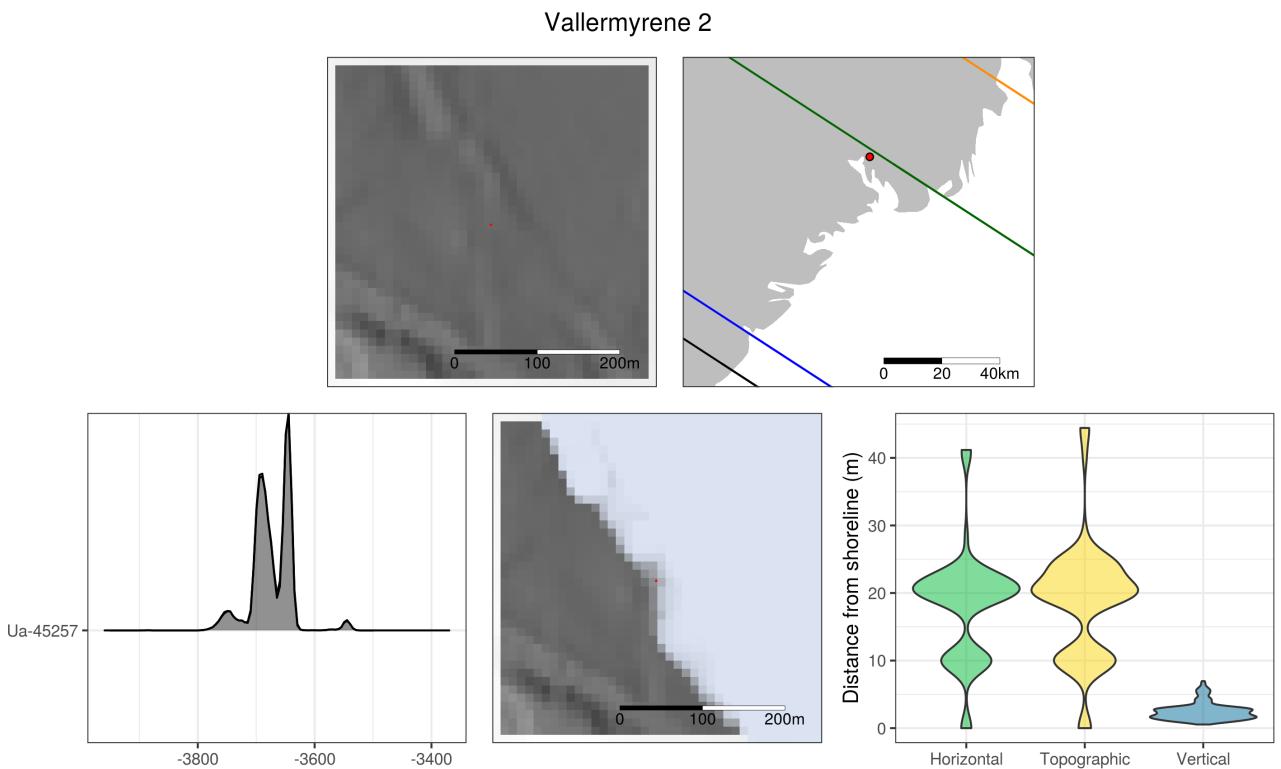

ID	$^{14}\text{C}$ BP	Error	Material	Context
Ua-45180	5373	34	Birch (Betula)	Cooking pit/fireplace (ID 391)

Vallermyrene 1b is the younger than Vallermyrene 1a (above), as indicated both by the radiocarbon date, typology and elevation (Reitan 2014f). The DTM did not require editing.

Table 66: Vallermyrene 2

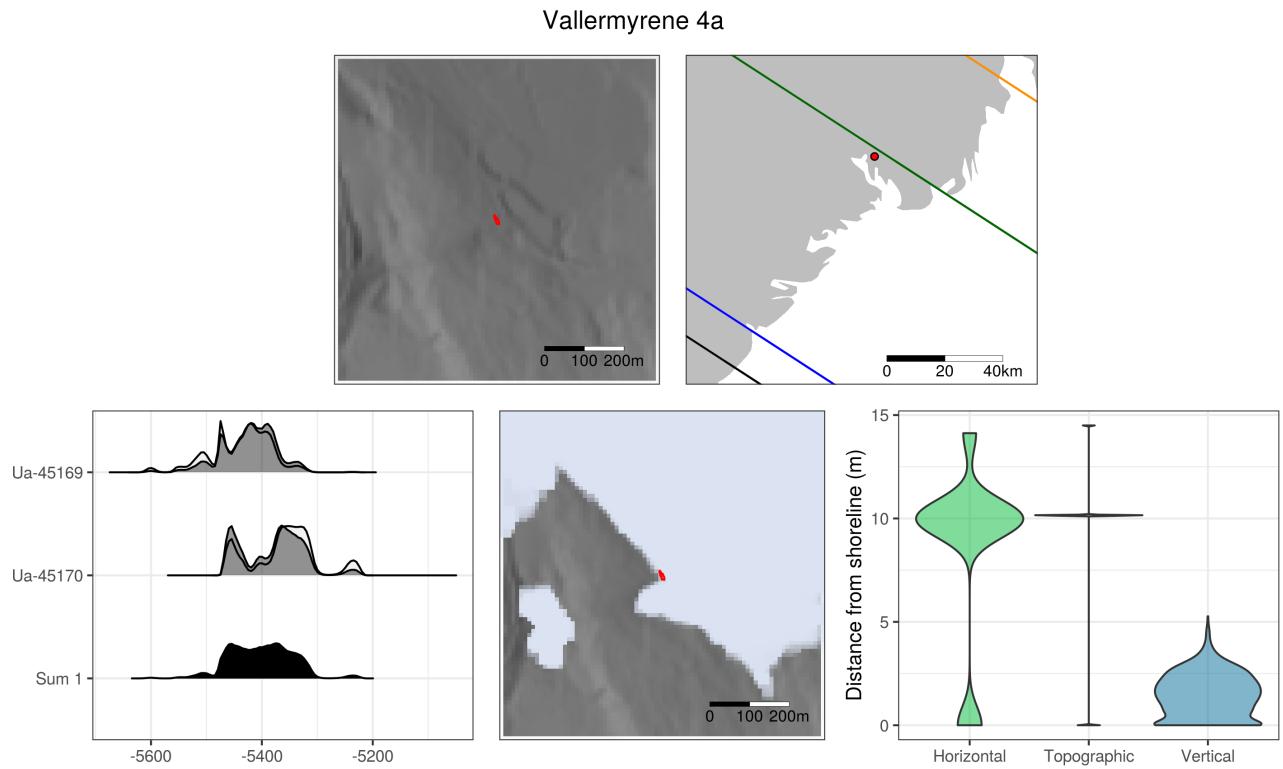

ID	$^{14}\text{C}$ BP	Error	Material	Context
Ua-45257	4890	32	Hazel ( <i>Corylus</i> )	Fireplace (ID 1017)
Ua-45253	3047	32	Birch ( <i>Betula</i> )	Cooking pit? (ID 4026)
Ua-45258	2821	30	Willow ( <i>Salix</i> )	Post hole? (ID 4455)
Ua-45251	2243	32	Willow ( <i>Salix</i> )	Cooking pit (ID 350)
Ua-45256	2181	30	Birch ( <i>Betula</i> )	Post hole (ID 2889)
Ua-45255	2156	30	Birch ( <i>Betula</i> )	Cultivation layer (Profile in trench)
Beta-324757	2120	30	Hazel ( <i>Corylus</i> )	Cultivation layer (611x554y)
Ua-45259	2009	30	Birch ( <i>Betula</i> )	Cultivation layer (Profile)
Ua-45260	1942	30	Birch ( <i>Betula</i> )	Post hole (ID 4210)
Ua-45249	1846	31	Birch ( <i>Betula</i> )	Cooking pit (ID 545)
Ua-45248	1803	31	Birch ( <i>Betula</i> )	Cooking pit (ID 437)
Ua-45252	1654	30	Birch/hazel/rowan ( <i>Betula/Corylus/Sorbus</i> )	Undefined feature (ID 3351)
Ua-45254	1593	30	Pine ( <i>Pinus</i> )	Post hole (ID 4468)
Ua-45250	1560	32	Birch ( <i>Betula</i> )	Cooking pit/fireplace (ID 1043)

Vallermyrene 2 was a large site situated in a field (Reitan 2014g). The site has  $^{14}\text{C}$ -dates and artefacts dating occupations at the site to multiple phases throughout prehistory, including the Bronze Age and phases up until the Viking Age. The Stone Age activity on the site was evidenced by 359 lithics and a fireplace dated to the Early Neolithic. Given its uncertain extent, the site limit used here is defined by the fireplace.

Table 67: Vallermyrene 4a

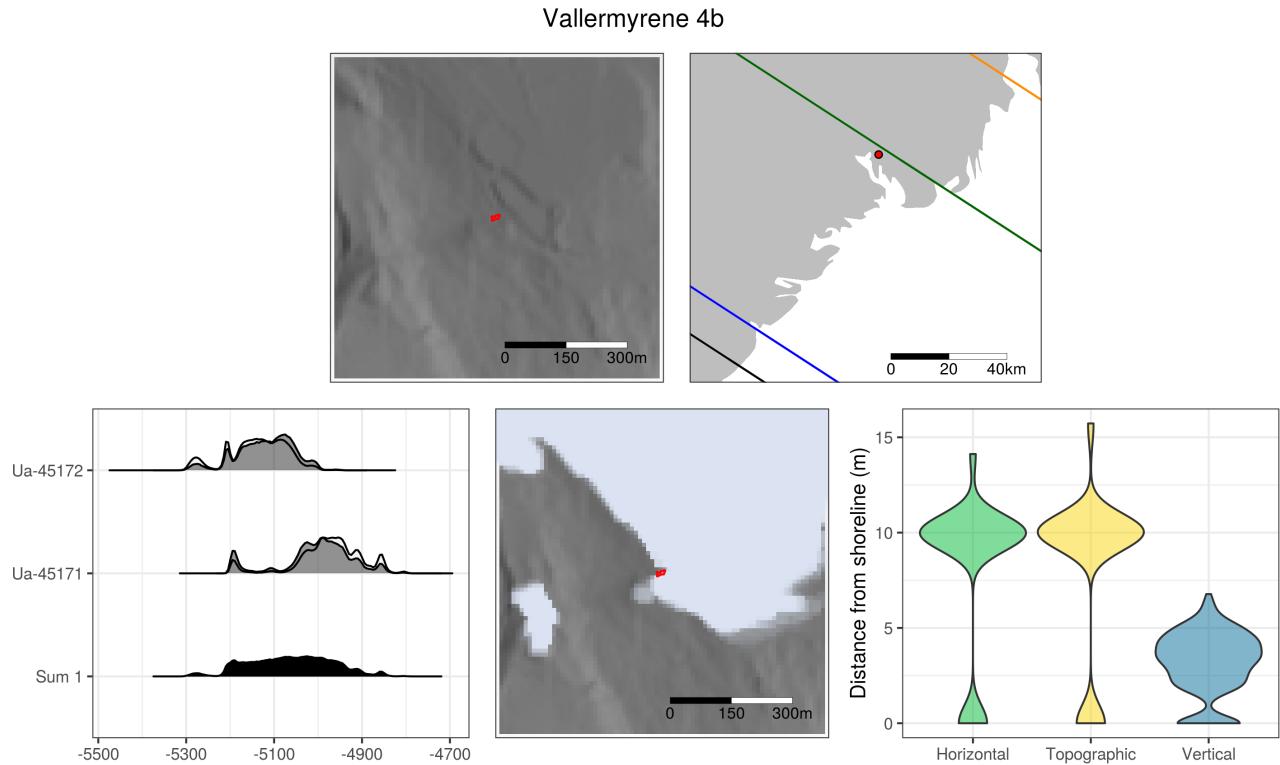

ID	$^{14}\text{C}$ BP	Error	Material	Context
Ua-45169	6489	50	Burnt bone, mammal (0.5g)	Quadrant (894x242yNE, layer 1)
Ua-45170	6381	37	Burnt bone, mammal (1g)	Quadrant (892x243yNW, layer 3)

Vallermyrene 4 was, as with Vallermyrene 1 (above), divided into Vallermyrene 4a and 4b based on radiocarbon dates and differences in elevation (Eigeland and Fossum 2014). Typologically the sites are identical, and match the  $^{14}\text{C}$ -dates. Vallermyrene 4a is the older of the two and was less disturbed by modern activity before the excavation. The railway runs just east and north-east of the site and had to be removed. In addition, what appears to be a gravel pit was located to the south-west. Both railway and gravel pit appear to have been adequately edited in the employed DTM.

Table 68: Vallermyrene 4b

ID	$^{14}\text{C}$ BP	Error	Material	Context
Ua-45172	6197	40	Pine (Pinus)	Refuse/storage pit (ID 896)
Ua-45171	6067	41	Pine (Pinus)	Refuse/storage pit (ID 896)

Vallermyrene 4b is slightly younger than Vallermyrene 4a (above). Typology and radiocarbon dates match (Eigeland and Fossum 2014). The DTM was edited to remove the railway track running by the site and a gravel pit.

### Numerical result of re-dating

Table 69: Shoreline dating previously shoreline dated sites. The range of the 95% HDR is rounded off to the nearest 10 years to reduce spurious precision.
